Early Childhood Risk and Reach in Louisiana This report was compiled and edited primarily by the Louisiana Department of Health, Office of Public Health's Bureau of Family Health, but would not have been possible without extensive collaboration between multiple Louisiana State Departments, Offices, and Bureaus, all of whom provided data, written narratives, and expert consultation.

These include:

LOUISIANA DEPARTMENT OF HEALTH (LDH)

- ▶ MEDICAID
- ▶ OFFICE OF PUBLIC HEALTH
 - BUREAU OF FAMILY HEALTH
 - **•** BUREAU OF NUTRITION SERVICES
- ▶ OFFICE FOR CITIZENS WITH DEVELOPMENTAL DISABILITIES

• EARLYSTEPS

LOUISIANA DEPARTMENT OF EDUCATION (LDOE)

LOUISIANA DEPARTMENT OF CHILDREN AND FAMILY SERVICES (DCFS)

- CHILD WELFARE
- FAMILY SUPPORT

Additionally, many subject matter experts from academic institutions, and other nonprofit organizations in Louisiana contributed their knowledge and expertise throughout the report creation process. Subject matter experts participated in the selection of new risk indicators, provided written interpretation of risk indicators aligned with their area of expertise, and reviewed report sections to ensure accuracy and quality. The non-governmental organizations that these subject matter experts are affiliated with include:

AGENDA FOR CHILDREN

AMERICAN ACADEMY OF PEDIATRICS - LOUISIANA CHAPTER

LOUISIANA BUDGET PROJECT

LOUISIANA POLICY INSTITUTE FOR CHILDREN

LOUISIANA PARTNERSHIP FOR CHILDREN AND FAMILIES

LOUISIANA PUBLIC HEALTH INSTITUTE

LOUISIANA STATE UNIVERSITY ROBERT REICH SCHOOL OF LANDSCAPE ARCHITECTURE

TULANE CENTER FOR INFANT AND EARLY CHILDHOOD MENTAL HEALTH

TULANE SCHOOL OF PUBLIC HEALTH AND TROPICAL MEDICINE

Creation of this report was led by Fiona Ritchey, MPH, with primary data analysis conducted by Bianca Magee, MPH.

This project was supported in part by the Health Resources and Services Administration (HRSA) of the U.S. Department of Health and Human Services (HHS) Title V MCH Block Grant award. This information or content and conclusions are those of the authors and should not be construed as the official position or policy of, nor should any endorsements be inferred by HRSA, HHS or the U.S. Government.

63 NEIGHBORHOOD & BUILT ENVIRONMENT

HOW TO USE THIS REPORT

The 2021 Early Childhood Risk and Reach in Louisiana report uses parish level data to describe the risks and challenges that young children and families face across five categories: ECONOMIC STABILITY, HEALTHCARE ACCESS AND QUALITY, SOCIAL AND FAMILY CONTEXT, EDUCATION ACCESS AND QUALITY, and NEIGHBORHOOD AND BUILT ENVIRONMENT. The report also describes the reach of key publicly-funded programs that address these risks and challenges. Data on program reach are overlaid onto maps of overall risk, which helps to illustrate which parishes may require additional services and investments to support children's health and well-being.

Whether you are a state legislator, program manager, child advocate, teacher, community organizer, or a concerned citizen, this report was designed to serve as a primary reference for reliable data on early childhood in Louisiana. The report can function as a tool and guide to help you take effective action to promote family health and wellness on multiple levels. We recommend using this report to do the following:

DEVELOP EARLY CHILDHOOD POLICIES AT THE LOCAL AND STATE LEVEL:

Investments in young children have the potential to affect a broad range of outcomes for years to come.

DEVELOP AND EVALUATE OTHER KINDS OF POLICIES AT THE LOCAL AND STATE LEVEL:

Many policies that do not directly mention children have significant impacts on children and families.

WRITE GRANTS:

Funders often ask for data on community needs and the reach of existing programs in those communities.

ADVOCATE FOR CHANGE:

Data and expert recommendations are critical to building and securing support for policy and practice changes in your state or community.

The central purpose of the 2021 Early Childhood Risk and Reach in Louisiana report is to put early childhood data and research into the hands of people and organizations who can translate this information into actions and policies, creating lasting benefits for Louisiana communities. It is intended to empower you to make data-informed decisions that help Louisiana's children reach their full potential in school, in the workforce, and throughout their lives.

For questions or comments, please contact Amy Zapata at Amy.Zapata@la.gov with the subject "Risk and Reach Report Inquiry."

-	
l	

BUILD COALITIONS:

Organizations and sectors that do not typically work together can become stronger and more effective champions for children if they understand their collective impact on families, and direct shared resources to areas of greatest need.

IMPROVE DATA COLLECTION AND SHARING:

This report can serve as a baseline data reference to help determine what additional data are needed to better understand the challenges Louisiana families face and opportunities to more effectively support them. Further, this report highlights a need for improved infrastructure to share data that will generate action to improve the lives of Louisiana's children.

EXECUTIVE SUMMARY

Early Childhood Risk and Reach in Louisiana Executive Summary | WINTER 2021

.

PURPOSE

The 2021 Early Childhood Risk and Reach in Louisiana report is a tool designed to be used by all early childhood stakeholders, governmental and nongovernmental, to better inform policy and funding decisions that impact the distribution of critical resources. When looking at evidencebased measures of children's well-being, Louisiana has consistently scored poorly in comparison to the rest of the country. Early childhood experiences and circumstances have a profound and lasting influence on a child's ability to reach his or her full potential. It is imperative that policymakers, public health professionals, and other key stakeholders monitor specific indicators of early childhood well-being. To this end, this report is comprised of two parts:

- ▶ **RISK:** an analysis of 21 indicators that measure risks to the health and well-being of Louisiana children ages 0-5 at the state and parish level, and
- **REACH:** an analysis of state and parish level availability ("reach") of eight publicly-funded programs that serve young children.

7

METHODOLOGY

The risk indicators included in this report span across five domains, which are based on the Social Determinants of Health¹ as defined by the World Health Organization in their Healthy People 2030 framework². These Social Determinants of Health domains include Economic Stability, Healthcare Access and Quality, Social and Community Context, Education Access and Quality, and Neighborhood and Built Environment. Data in this report are presented at the state and parish level.

For each risk indicator, parishes are sorted into ranked quartiles from Low to High risk, based strictly on a comparison of parishes within Louisiana. An average score across all 21 indicators is used to define the overall risk of each parish. Based on their average scores, parishes are placed in one of four overall risk groups: Low, Low-Moderate, Moderate-High, and High.

Reach was determined by requesting parish level enrollment data from eight major publicly-funded programs that serve young children across Louisiana. All programs are administered by either the Louisiana Department of Health or the Louisiana Department of Education, Similar to the risk indicators, reach indicators are sorted into ranked quartiles based on enrollment. Reach indicator data is overlaid onto the map of Overall Risk in order to illustrate the reach of these programs relative to the need (risk) of each parish.

UPDATES FROM THE 2016 EARLY CHILDHOOD RISK AND REACH IN LOUISIANA REPORT

The 2021 iteration of the Early Childhood Risk and Reach in Louisiana report includes expanded and reorganized Risk and Reach sections compared to previous reports. Specifically, this report improves upon the 2016 Early Childhood Risk and Reach in Louisiana report by expanding the Risk section from 12 indicators across three domains to 21 indicators across five domains, with conclusions for each category of risk. The Reach section is also updated to include Medicaid and WIC (the Special Supplemental Nutrition Program for Women, Infants, and Children) and education reach is presented differently. Rather than showing the reach of specific funding streams for publicly funded pre-kindergarten (Title I, NSECD, 8(G), LA 4), this report presents more comprehensive data on access to high quality, publicly funded child care for children ages 0-3 and pre-K for children age 4.

TABLE 1. Young Children in Louisiana by Risk Level

RISK GROUP	NUMBER OF PARISHES	NUMBER OF CHILDREN (0-5)	PERCENTAGE OF CHILDREN (0-5)
Low	16	114,615	37.3%
Low-Moderate	16	119,249	38.8%
Moderate-High	13	17,890	5.8%
High	19	55,338	18.0%

¹ Betrieved from: https://health.gov/healthypeople/objectives-and-data/social-determinants-health

² Retrieved from: https://health.gov/healthypeople/about/healthy-people-2030-framework

FINDINGS: RISK

There are an estimated 307,092 children under age 5 in Louisiana. An average score of "Low Risk" suggests that the young children in that parish are more likely to be healthy and ready for school, relative to children in parishes with higher risk scores. In contrast, a score of "High Risk" suggests that the young children in that parish are at risk for poor mental and physical health outcomes. Children in "High Risk" parishes are also specifically at greater risk for entering school with delays that make learning more challenging, remaining behind in school, and leaving school less prepared for the workforce or further education.

Overall Risk: In total, 73,228 children live in the 32 parishes that are classified as either Moderate-High or High Risk, representing approximately 23.8% of all children under age 5 in Louisiana. For a full list of risk indicators, please see the Overall Risk section on page 75.

FINDINGS: REACH

Louisiana has leveraged both state and federal funds to provide access to eight key programs and services for young children: Medicaid; WIC; EarlySteps; Maternal Infant and Early Childhood Home Visiting (MIECHV); Early Head Start; Head Start; high-quality, publicly funded child care for children ages 0-3, and high-quality, publicly funded pre-K for children age 4. These programs provide effective services and supports to young children and their families that help prepare children for success in school, work, and life. Ensuring broad access to these programs, particularly for areas of the state with high levels of risk for young children, is a critical step to ensure that families in Louisiana are healthy and thriving.

CONCLUSION

High-quality data and analyses are essential to inform programmatic and investment decisions that guide the distribution of resources that support Louisiana's young children. While certain parishes are considered higher risk environments for young children, it should be noted that 98% of all Louisiana parishes (63 out of 64) are rated as "High Risk" on at least one indicator. Conversely, 97% of all Louisiana parishes (62 out of 64) are rated as "Low Risk" on at least one indicator. These data make it clear that every parish, regardless of its ranking, has strengths to build upon, as well as vulnerabilities to address.

Many of the risk factors affecting young children in Louisiana are not equally distributed throughout the population. As this report shows, Black children face more disadvantages on average than White children, which is a result of centuries of structural racism.³ In a policy statement released by the American Public Health Association, racism is defined as "the system of structures, processes, and values that results in differential outcomes by 'race'; racism is manifest on cultural, institutional, interpersonal, and internalized levels".⁴ Addressing racial disparities in risk factors facing young children requires addressing racism as the root cause of these disparities.³

While the eight early childhood programs named in this report use their resources to provide services for as many eligible children as possible, there are many more children in Louisiana who could benefit from these programs. These programs have established evidence to prove that they are effective in promoting a broad range of positive health, education, and economic outcomes among participants. These programs need adequate and sustainable funding to serve all children who could benefit from them.

The information compiled in this report, complemented by the separate Early Childhood System Integration Budget, has a variety of immediate applications.⁵ It can be used to describe community needs in grant applications, evaluate or create early childhood policy and programming, identify gaps in existing data systems, and catalyze more effective collaboration across organizations and sectors. It is intended to empower readers to take data-informed action to improve the lives of Louisiana families and children, from this generation to the next.

RISK

"Risk" in this section refers to a range of individual, family, or community-level factors that place Louisiana children ages 0-5 at risk for negative outcomes, some of which may persist throughout their lifetimes. Data on these risks are presented at the parish level, using maps to illustrate the geographic distribution of children's exposure to these risk factors. State and national averages are presented for comparison whenever possible. Risk indicators are then compiled and averaged to create a map of Overall Risk. For both individual risk indicators and Overall Risk, parishes are ranked into quartiles based on each parish's percentage of children at risk relative to other parishes; the quartiles are designated as Low, Low-Moderate, Moderate-High, and High Risk.

This edition improves upon the 2016 Early Childhood Risk and Reach in Louisiana report by expanding the Risk section to include 21 indicators of risk across the five categories of Social Determinants of Health, as defined by the World Health Organization's Healthy People 2030 framework: Economic Stability, Healthcare Access and Quality, Social and Community Context, Education Access and Quality, and Neighborhood and Built Environment. The previous report covered three domains, using 12 indicators of risk. This expanded purview gives a more comprehensive overview of risks to children's health and well-being in Louisiana, and highlights additional areas of opportunity to improve family and community health.

PERCENTAGE OF CHILDREN UNDER AGE 5 LIVING IN POVERTY (2014-2018)

Poverty in early childhood touches virtually every dimension of well being. Compared to their wealthier peers, young children in poverty are more likely to experience worse physical, mental, and behavioral health, including negative structural changes that occur during early brain development.⁶ Later in life, youth who experienced poverty in early childhood are more likely to demonstrate increased risky behaviors in adolescence, and decreased educational and professional attainment over their lifetimes.⁷

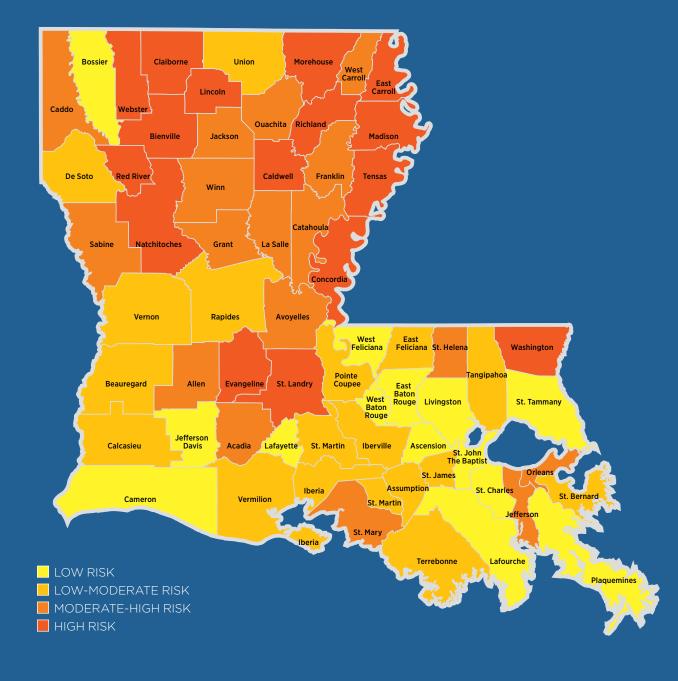

In 2020, the Federal Poverty Level (FPL) was \$26,200 for a family of four. In Louisiana from 2014-2018, 30.8% of children under 5 lived in poverty, which represents a significantly higher rate than the nationwide average of 21.5%. Unfortunately, the poverty rate for children ages 0-5 in Louisiana is tied with New Mexico for secondhighest in the country.⁸ While the percentage of children living in poverty in Louisiana decreased by a modest 2.5% since the last Risk and Reach report in 2016, the state has not kept pace with national trends. Since 2016, the national rate of children under age 5 living in poverty decreased by 10%.⁹

Within Louisiana, the percentage of children under age 5 living in poverty varies widely by parish, from 13.4% in Livingston Parish to 85% in East Carroll. In seven parishes, more than half of children under 5 live in poverty. Only nine parishes had young child poverty rates below the national average. Black children in Louisiana are three times more likely to live in poverty than White children.¹⁰ Modest gains attained recently in lowering poverty rates for Black children are currently under threat due to the disproportionate economic impact of COVID-19 on Black workers, including the parents of young children.¹¹

PARISH LEVEL MEDIAN INCOME AS A PERCENTAGE OF FEDERAL POVERTY LEVEL (2014-2018)

Median income refers to the exact middle of income distribution half of all households make more, and half make less. Median income is less sensitive to extreme highs and lows than other measures, such as per-capita or average household income. Comparing median household income to the Federal Poverty Level (FPL) provides valuable context to the relative economic health of households. Household income is a leading indicator for many lifetime outcomes for children, including physical and mental health, educational attainment, and labor market success.¹² Family income also impacts mothers' mental health, which is a significant indicator for healthy early childhood development.^{13,14}

Louisiana compares poorly to the nation as a whole. The state has a median household income at 186% FPL, while the national rate is 234%. For the first time since this report has been published, the median income in two parishes (East Carroll and Tensas) has fallen below the FPL.

While national household median income increased by 5% since 2016, Louisiana's has remained largely flat, increasing by only 1% over the same time period.¹⁵ In 2018, Louisiana had the 4th highest income inequality of any state in the country.¹⁶ Decades of wage disparities by race and gender in Louisiana means that families of color—which are disproportionately headed by women—not only struggle to make ends meet, but also fall behind in savings and wealth-building.¹⁷ The gap between Black and White worker wages has increased over the past four and a half decades.¹⁵ This persistent inequality has long-term implications for the state and the young children who live here.

PERCENTAGE OF HOUSEHOLDS BELOW ALICE (ASSET LIMITED, INCOME CONSTRAINED, EMPLOYED) THRESHOLD (CALENDAR YEAR 2018)

In 2016, the Louisiana Association of United Ways joined United Ways from states across the country and created the first Louisiana ALICE Report to shed light on the prevalence and needs of the ALICE population in our state—Asset Limited, Income Constrained, Employed. The ALICE Report uses a standardized set of measurements to quantify the cost of a basic household budget in each county/parish in each participating state, and to show how many households are struggling to afford this budget. The number of households living under the ALICE survival budget threshold indicates the level of financial instability in a given region.¹⁸

The most expensive item in Louisiana's ALICE survival budget is child care, which is essential for parents to work and to prepare children for kindergarten. Shortages in one area of a family's budget have consequences in other areas. Nowhere is this more apparent than in early childhood, when it is critical for children to have safe housing, nutritious food, quality child care, comprehensive healthcare, and reliable transportation to make healthy development possible. When working families don't earn enough income to provide these essentials, children's development and lifetime potential can be negatively impacted.¹⁹

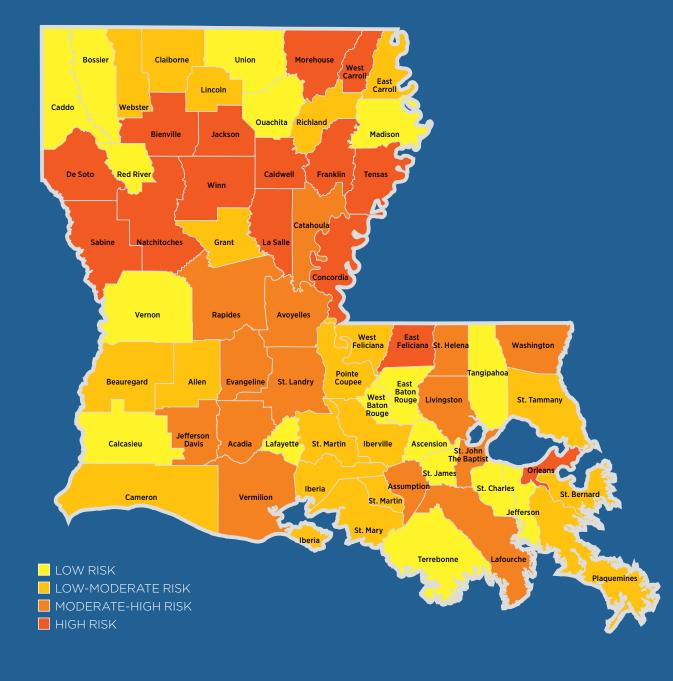

Louisiana and Mississippi are the two states with the highest percentage of households living under the ALICE threshold (55% each) in the United States.²⁰ ALICE households are in every parish in Louisiana—urban, suburban, and rural—and they include people of all genders, ages, and races/ethnicities, across all household types. Financial hardship, as measured by the number of households living below the ALICE threshold, is markedly higher for non-White families with children, as well as households headed by single women. The percentage of households living under the ALICE threshold in Louisiana ranges from 38% in Ascension Parish to 72% in Tensas Parish.

Early Childhood Risk and Reach in Louisi Risk | WINTER 2021

PERCENTAGE OF SNAP RECIPIENTS UNDER AGE 5 (CY 2019)

The Supplemental Nutrition Assistance Program (SNAP) provides nutrition benefits to low-income families to supplement their food budget and promote healthy eating. SNAP benefits are used to purchase food each month, including items like bread, cereal, fruit, vegetables, meat, fish, dairy products, and snacks. Children living in low-income households are more likely to be food insecure. Beyond inadequate intake of important nutrients, food insecurity is associated with deficits in cognitive development, behavioral problems, and poor health during childhood.²¹ Targeting SNAP assistance toward families with young children helps lift these families out of poverty, improves food security, and bolsters children's cognitive development, long-term health, and economic prospects.²²

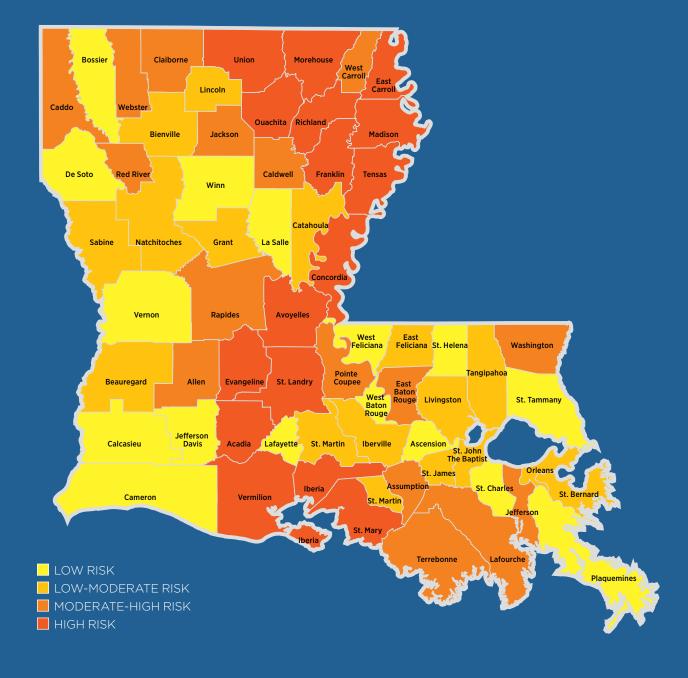

According to the United States Department of Agriculture, Louisiana leads the nation in child food insecurity, with 24.6% of children experiencing food insecurity across the state.²³ Across Louisiana, 16.3% of SNAP recipients are 5 years old or younger, ranging from 12.2% in West Carroll Parish to 17.9% in Calcasieu Parish. Higher rates of SNAP benefits going to younger children indicate a reduced level of risk associated with food insecurity.

PERCENTAGE OF BIRTHS TO MOTHERS WITH LESS THAN HIGH SCHOOL EDUCATION (CY 2018)

Low parental education has a well-documented impact on a child's cognitive and social-emotional development. Young children, in particular, may be more susceptible to this influence because parental education level can provide for (or reduce) opportunities for cognitive enrichment during this critical developmental period.²⁴ Furthermore, financial strain resulting from limited earning opportunity due to lack of education can increase a mother's stress level, negatively impact maternal mental health, and make parenting more challenging.²⁵ These factors are all associated with behavior problems and poor learning outcomes in preschoolers.²⁶

Louisiana's percentage of births where the head of household has less than a high school education is greater than the national average (14.71% in Louisiana, compared to 13% nationally). However, compared to the 2016 Louisiana Risk and Reach report, this measure decreased from 17.6% to 14.7%. Additionally, in the 2016 report, 23 parishes had more than 20% of babies born to heads of household with less than a high school degree, whereas in 2018, only 9 parishes saw rates over 20% for this measure.

RISK: ECONOMIC STABILITY CONCLUSION

Family economic stability is the foundation of health and well-being. When families have access to jobs that provide livable wages and benefits (such as health insurance and paid family leave), children grow up physically and mentally healthier.²⁷ For instance, a study conducted in 2014 demonstrated that raising the U.S. federal minimum wage by \$1 would have resulted in 2,790 fewer low birthweight newborns and 518 fewer postneonatal deaths across the country that year.²⁸ Increased family income is also associated with improved academic performance among children in school and increased likelihood of children securing stable employment as adults.²⁹ Unfortunately, Louisiana ranks 46th on median household income out of 50 states, suggesting that many Louisiana families do not experience economic stability.³⁰ In particular, Louisiana ranks 49th in children ages 0-4 living in poverty,³¹ which confers substantial risks to the lifelong health, well-being, and educational and professional attainment of Louisiana's children.

According to the Louisiana Association of United Ways' 2020 ALICE (Asset Limited, Income Constrained, Employed) Report, 32 which is based on 2018 data, Louisiana has been experiencing steady economic growth since the Great Recession, but wages have not kept pace with the cost of living. The number of Asset Limited, Income Constrained, Employed (ALICE) families is growing. The 2018 Household Survival Budget for a two-parent family in Louisiana with an infant and a preschooler is \$69,732, which would require both parents working full time to make an hourly wage of \$17.44 after taxes. This is nearly 2.5 times the federal minimum wage of \$7.25, which Louisiana uses.

While the full economic impact of the COVID-19 pandemic on the Louisiana economy is not yet known, approximately 44% of all Louisiana employees work in sectors with a high level of economic exposure to the pandemic, including the retail, food service, and arts and entertainment.³³ At the peak of pandemic-related economic restrictions in April 2020, the unemployment rate was 15.1%-nearly triple what it had been in February 2020 (5.2%), the last full month before the state of emergency began.³⁴ Even as the Louisiana economy started moving toward recovery, unemployment remained high at 9.4% in October 2020. Without guaranteed paid family leave for all full-time workers, many employed families have suffered lost wages caring for children or sick family members. The pandemic also disrupted and continues to disrupt child care and in-person school attendance, creating further challenges for families trying to find work.

It is important to note, however, that all of the data included in this section were collected prior to the pandemic. Economic vulnerability and instability have been significant issues for families in Louisiana for years. As advances in the development of COVID-19 vaccines and treatment usher in hope for a return to normal activities, the need remains the same. Louisiana families must have access to stable jobs that provide living wages and benefits, without sacrificing their health and safety, in order for the state to rebuild and sustain a healthy and

PRETERM BIRTH RATE (PERCENTAGE; CY 2018)

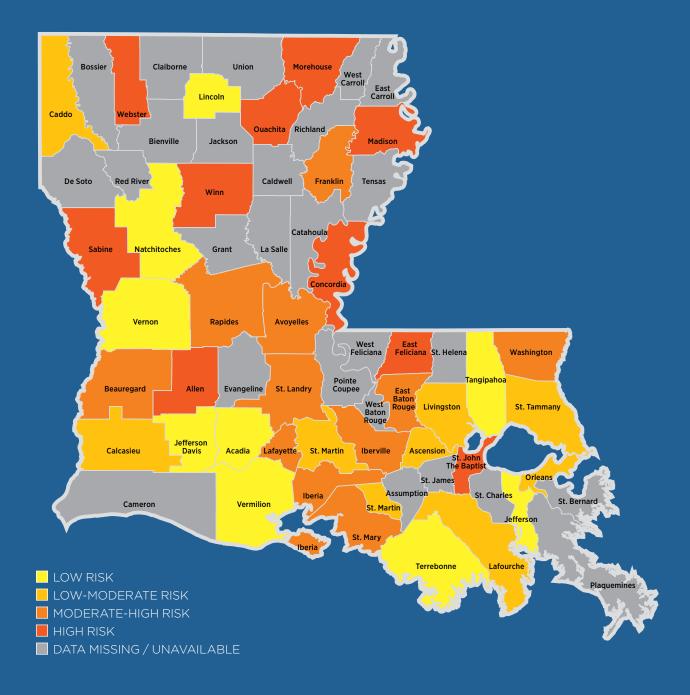

Infants born more than three weeks before their due date, or before 37 weeks of gestation, are considered preterm. Many of the consequences of preterm birth, both short and long-term, can be attributed to incomplete development. Inadequate development as a result of early birth can impact the respiratory system, immune system, skin, cardiovascular system, central nervous system, and systems related to hearing and vision,³⁵ and increased risk for infant mortality. Young children born preterm can experience cognitive and motor deficits, emotional and behavioral problems, and difficulty interacting with peers.³⁶ Prenatal care has been associated with significant reductions in preterm birth rates.³⁷

Louisiana's preterm birth rate (13%) is higher than the national average (10%). Fifty-nine of Louisiana's 64 parishes (92%) have a preterm birth rate above the national average, and 21 of those parishes (33%) have preterm birth rates above 150% of the national average. In Tensas and Franklin parishes, over 1 in 5 babies are born preterm. Preterm birth rates are significantly higher for Black persons than non-Hispanic White persons.³⁷ While personal health behaviors, such as diet and smoking, can affect the likelihood of having a preterm birth, social and environmental factors rooted in systemic racism play a larger role in the observed preterm birth disparity.³⁸ In Louisiana during 2018, White and Hispanic women both met the *Healthy People 2020* target of 11.4% for preterm birth rate at 10.6% and 10.8%, respectively, whereas Black women had a preterm birth rate of 17%.³⁹

RATE OF SUBSTANCE EXPOSED NEWBORNS (PER 1,000 BIRTHS; CY 2019)

This indicator represents the rate of infants born in Louisiana who were determined by the Department of Children and Family Services (DCFS) to be "substance exposed newborns" following Child Protective Services investigations per 1,000 births. In order to classify a child as a substance exposed newborn, the legal criteria for prenatal neglect must be met. Prenatal neglect includes the following criteria:

- Prenatal exposure to chronic or severe use of alcohol;
- A pregnant person's unlawful use of any controlled and dangerous substance, or use in a manner not lawfully prescribed, which results in symptoms of withdrawal, or;
- The presence of a controlled substance in the infant that is not the result of medical treatment.

Depending on the substance and level of exposure, substance exposed newborns may experience a range of long-term effects, including disrupted physical development, learning disabilities, and behavioral problems.⁴⁰ Prenatal exposure to opiates has a well-documented association with neonatal opioid withdrawal syndrome, and an apparent long-term effect on behavior, but more research is needed to determine long-term developmental effects.⁴¹ In contrast, prenatal exposure to legal substances such as alcohol and nicotine has very well-documented negative effects on fetal growth, as well as long term effects on cognition, behavior, and intellectual disability.⁴¹ Best practice care models that engage families in the care of their newborns with opioid exposure can reduce the severity of Neonatal Opioid Withdrawal Syndrome (NOWS) symptoms, and reduce the need for pharmacological care and length of hospital stay.⁴²

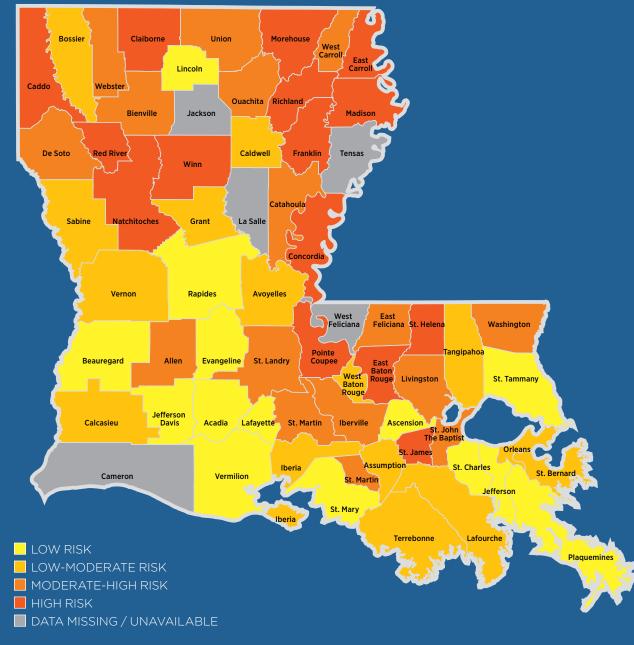

In 2019, 2,031 newborns met the criteria of "Substance Exposed Newborn" which represents 3.5% of all live births in Louisiana. Over 20% of DCFS investigations for children under age 5 in Louisiana involve the allegation of substance exposed newborn. Rates of substance exposed newborns in Louisiana vary substantially between parishes, ranging from 13.2 per 1,000 in Natchitoches to 156 per 1,000 in Concordia. Higher rates of newborns with substance exposure were concentrated in Northern Louisiana and the River parishes. Geographic data on substance exposed newborns is captured by DCFS assigned worker location, not necessarily by a child's parish of residence, resulting in several parishes lacking data on this indicator.

INFANT MORTALITY RATE (PER 1,000 BIRTHS; 2014-2018)

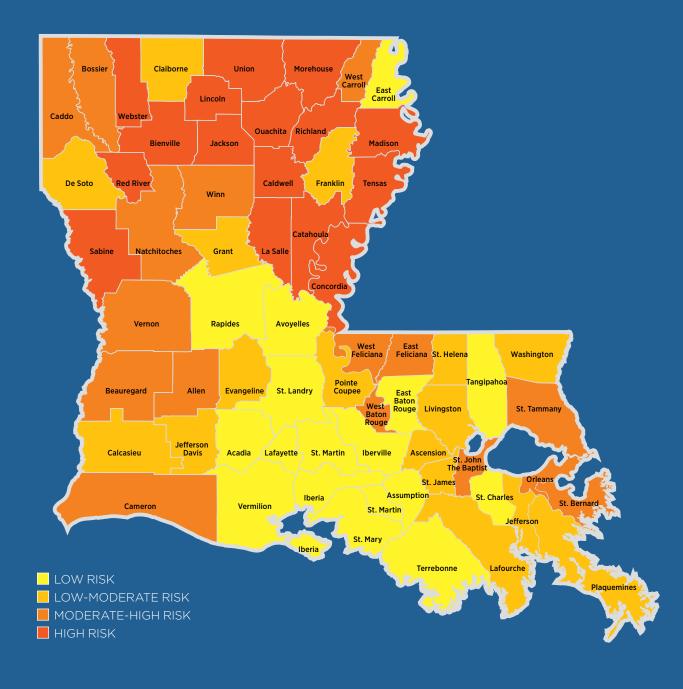

Infant mortality refers to deaths of children who are less than 1 year old. The infant mortality rate is the number of infants who die before their first birthday, per 1,000 live births. Beyond the direct impacts that losing an infant has on a family, infant mortality is an important marker for the overall health of a community or society. Factors related to infant mortality in Louisiana include high rates of preterm birth and low birth weight, high rates of obesity and chronic medical conditions among birthing persons of reproductive age, and high levels of poverty.⁴³ Some causes of infant deaths are preventable, especially those related to injury and suffocation.⁴³ Among injuryrelated deaths, more than 75% were associated with Sudden Unexpected Infant Death (SUID), which includes those related to suffocation and unsafe sleep environments.⁴⁴ Prenatal care has been associated with a reduction in adverse birth outcomes, including infant mortality.⁴⁵

Louisiana's infant mortality rate (7.8 per 1,000) was about 34% greater than the national rate (5.8 per 1,000). In 56 out of 64 parishes (88%), the infant mortality rate was higher than the national average. However, Louisiana's infant mortality rate has decreased since the 2016 Risk and Reach report (8.3 per 1,000), when Louisiana's rate was 41% greater than the national rate. Ten parishes in Louisiana had an infant mortality rate of at least twice the national rate, while only eight parishes were lower than the national rate. There were fewer than five infant deaths in five parishes—for confidentiality reasons, infant mortality rates are not calculated for parishes with counts less than five.

Considerable disparities in infant mortality exist by both geography and race/ethnicity in Louisiana. Infants in rural parishes are significantly more likely to die in their first year of life compared to infants in urban and suburban parishes, largely due to the socioeconomic disadvantage common to rural areas.⁴⁶ Infants born to non-Hispanic Black mothers were more than twice as likely to die before their first birthday compared to their White counterparts.⁴⁶ Infant mortality rates can be reduced through public investments in improved social and environmental services, such as housing, parks and recreation, and solid waste management.⁴⁷

CHILDREN AGES 3-5 INSURED BY MEDICAID WHO DID NOT HAVE A WELL-CHILD VISIT THIS YEAR (CY 2019)

Well-child visits serve as key access points to essential disease prevention and health promotion services, such as critical childhood vaccines, developmental and behavioral health screenings, and health education for caregivers about key issues affecting young children.⁴⁸ Children who miss well-child visits tend to have lower vaccination rates and higher rates of preventable hospitalizations, such as hospitalization for asthma.^{49,50} Well-child visits function as crucial entry points to the larger system of evidence-based early childhood supports and services. When pediatricians screen young children for developmental risks and delays during well-child visits, they are better able to identify issues early and refer children to services during the critical periods for brain development.⁵¹ When early intervention services are received during these periods, they are at their most effective in promoting lifelong cognitive and socialemotional development, as well as lifetime educational attainment.⁵²

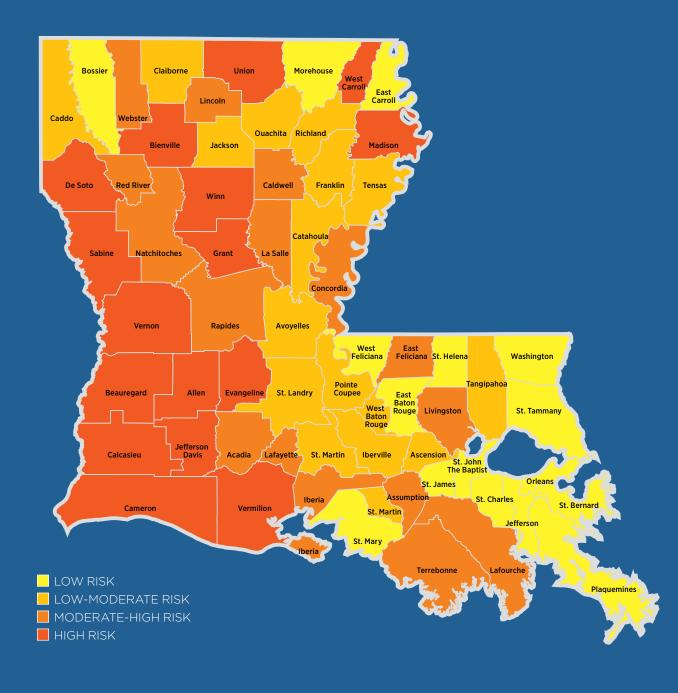

There are numerous barriers that can prevent a child from having practical access to well-child visits, including distance to the doctors' office, transportation issues, cost, lack of paid leave for parents, and parental depressive symptoms.⁵³

In Louisiana, 38.5% of 3-to-5-year-old children insured by Medicaid (the largest insurance provider for children in Louisiana, see page 81) did not receive a well-child visit in 2019. The lack of access to wellchild care ranges from 30.6% in Iberia Parish to 63.1% in Catahoula Parish. In one quarter of parishes in Louisiana (16 of 64), over half of all children ages 3-5 did not receive a well-child visit in the past year.

PERCENTAGE OF CHILDREN UNDER AGE 5 INSURED BY MEDICAID WHO DID NOT HAVE A PREVENTIVE DENTAL VISIT THIS YEAR (CY 2019)

Louisiana Medicaid, in alignment with the American Academy of Pediatric Dentistry, recommends that a child's first dental visit should occur no later than their first birthday, and should occur every 6 months thereafter.⁵⁴ Receiving preventive dental care significantly reduces the rate of non-preventive dental visits as well as non-preventive dental expenditures.55 This suggests that preventive dental care effectively reduces pediatric dental problems and the associated costs.⁵⁵ The consequences of tooth decay in young children's primary teeth include pain, poor nutrition, impaired speech development, misalignment in permanent teeth, and cosmetic effects.⁵⁶ If left untreated, decay can progress to dental abscesses and facial cellulitis.⁵⁶ Even with proper treatment, decay in the primary teeth of children is the single strongest predictor of developing caries in the permanent teeth.⁵⁷ Dental problems and non-preventive dental visits also have significant societal costs, from direct costs associated with treatment, to reduced productivity and lost wages for parents, to missing school and limiting activities for young children.58

Almost 60% of children under age 5 insured by Medicaid in Louisiana did not receive preventive dental care in 2019. In every parish of Louisiana, more than half of children under age 5 insured by Medicaid did not receive preventive dental services, from 53.6% in St. James Parish to 75% in Madison Parish. Thus, even in parishes where children receive the most preventive dental care (top quartile), young children insured by Medicaid still have limited access to dental care.

RISK: HEALTHCARE ACCESS & QUALITY CONCLUSION

Good health in infancy and early childhood supports lifelong health, educational attainment, workforce engagement, and social well-being.59 While other risk factors associated with the social determinants of health also have a significant impact on children's health (as outlined in the other sections of the report), County Health Rankings estimates that access to high-quality healthcare accounts for 20% of total population health outcomes.⁶⁰ For young children, this includes not only ensuring access to comprehensive pediatric care, but also ensuring that birthing persons have access to comprehensive prenatal, intrapartum, and postpartum care, including interpregnancy care.

Ensuring that birthing persons have access to comprehensive care before, during, and after pregnancy is associated with a range of improved birth outcomes, including reductions in preterm birth and infant mortality.^{61,62} Care during this time allows for the identification and mitigation of medical and social issues that can have negative effects on pregnancy outcomes. This includes the identification of substance use disorder, a leading cause of maternal mortality in Louisiana.63 Prenatal visits provide an opportunity for birthing persons who use substances to access evidence-based treatment through screening and referrals, which can improve birth outcomes for substance exposed newborns.64 The American College of Obstetricians and Gynecologists supports addressing prenatal substance abuse as a health problem, using education, prevention, and community-based treatment, rather than framing the issue as a criminal justice concern.65

Establishing well-child care begins with newborn care after delivery, and should continue throughout childhood and adolescence.66 These preventive care visits allow primary care providers to vaccinate children and systematically track their physical, cognitive, and behavioral development through developmental screening.⁶⁶ Screening allows providers to identify developmental delays and disabilities before a child goes to school and provide referrals to intervention services as early as possible, when those services are most effective.67

Preventive dental care may be perceived as secondary to other kinds of medical care, but dental problems can negatively affect children's overall health and school attendance.68 Regular visits to the dentist for cleanings and exams reduce the rate of cavities and other oral health problems.69

Significant changes in systems of care in Louisiana, have improved access to preventive medical and dental care for adults and children. Access to healthcare for adults expanded with the federal adoption of the Affordable Care Act (ACA), and Louisiana's decision to use federal tax dollars to expand Medicaid and serve more of the state's low-income workers in 2016.70 Because of the ACA, Louisiana has lower uninsured rates than the national average for both children and adults, including our neighboring Southern states of Texas and Mississippi.⁷¹ Medicaid expansion is also funding approximately 14,000 jobs across the state and bringing in an additional \$1.7 to \$1.8 billion dollars in federal funds to Louisiana above and beyond what was received prior to the expansion.71

Unfortunately, despite improved insurance coverage, there was a decrease in medical and dental care because of the COVID-19 pandemic. Many medical and dental providers had to limit in-person visits, with some providing virtual support to families or modified hours of operation in accordance with CDC guidelines.⁷² While these modifications were necessary to ensure the safety of families and patients, 28% of U.S. families with young children had to miss or delay well-child visits, resulting in delayed screening opportunities and decreased referrals to early intervention, family support and coaching, and other supports and services for young children and families.73

While health access is a key component of health outcomes, several other important indicators of children's health are not included in this report, primarily because of a lack of systematic data collection on those indicators. An example is data on administration of developmental screening. Beginning in 2021, Louisiana Medicaid adopted a reimbursement policy that will support data collection on developmental screening at the provider level.⁷⁴ Although Medicaid providers were required to administer developmental screens to every child on a regular basis prior to 2021, there has been no standardized way to capture data on whether a screen was performed at the appropriate intervals with a validated screening tool. In 2018, results from the National Survey of Children's Health showed that almost 80% of parents of infants and toddlers in Louisiana who responded to the survey reported not receiving a developmental screen at the doctor's office in the last year.75 Systematically collecting and analyzing these data can help identify areas of opportunity to improve screening as well as improve systems of care by referring children with developmental delays for appropriate services.

Similarly, there is currently no systematic data source to measure the rate of mental and behavioral health problems in young children. Mental health problems in children are frequently overlooked or considered behavioral or character problems, often resulting in punishment at home and at school rather than support.⁷⁶ Collecting and presenting quality data on this topic could help support the implementation of evidence-based mental health programs and services, and encourage therapeutic rather than punitive responses.

92% of Louisiana parishes have a higher preterm birth rate than the national average.

National

MALTREATMENT RATE OF CHILDREN UNDER AGE 5 (CASES PER 1,000 CHILDREN; CY 2019)

This indicator represents the number of children, from birth through 4 years of age, involved in a verified case of abuse and/ or neglect based on an investigation conducted by the Louisiana Department of Children and Family Services (DCFS). Abuse is defined as the maltreatment of a child, and can be physical, sexual, or emotional in nature. Neglect, on the other hand, refers to a failure to give children the care they need, and as a result, their health or safety is substantially impaired or threatened. Child maltreatment during infancy and early childhood has been shown to negatively affect child development.⁷⁷ The Adverse Childhood Experiences studies have found that childhood exposure to trauma is associated with significantly increased risk for a broad range of negative health outcomes over the life span, including heart attack, cancer, diabetes, substance abuse, depression, and early death.^{78,79}

In 2019, 4,180 Louisiana children under the age of 5 were verified to have experienced abuse and/or neglect. This represents 11.4 out of every 1,000 children in Louisiana under the age of 5. Within Louisiana, rates ranged from 4.2 cases per 1,000 children in Plaquemines Parish to 24.2 cases per 1,000 in Catahoula Parish. There were six parishes with maltreatment rates higher than 20 cases per 1,000 children, all of which are located in Central and Northeastern Louisiana. Of the three most populous parishes in the state (East Baton Rouge, Jefferson, and Orleans), only East Baton Rouge was above the state average at 13 cases per 1,000 children. These geographic patterns suggest that verified cases of child maltreatment may be more common in rural areas compared to urban areas, a finding that has been reported in the academic literature.^{80,81}

RATE OF CHILDREN UNDER AGE 5 IN FOSTER CARE (PER 1,000 CHILDREN; CY 2019)

This indicator represents the number of children under the age of 5 who entered the custody of the Louisiana Department of Children and Family Services (DCFS) in 2019 for at least one day. Foster care is the temporary care of a child outside the home that is utilized when the child's birth or legal family is unable to provide safe care for them. Within foster care, the child may be placed with a relative, fictive-kin (an individual who is not related by birth, adoption, or marriage to a child, but who has an emotionally significant relationship with the child), or in an unrelated foster family. While keeping a child with their family of origin is the preferred course of action, it is sometimes necessary to place a child in foster care due to abuse or neglect.

According to the American Academy of Pediatrics, having a stable relationship with a nurturing, protective adult who cultivates trust and security is critical for a child's healthy brain development.⁸² Experiencing abuse or neglect impacts this relationship, and entry into foster care may further disrupt the development of a nurturing, protective, and trusting relationship with a caretaker.⁸³ Children who enter or remain in foster care have disproportionately high rates of physical, developmental, and mental health problems, and often have many unmet medical and mental healthcare needs.⁸⁴

In 2019, 2,665 Louisiana children under the age of 5 (2.9 per 1,000 children), spent at least one day in foster care, compared to the national average of 2.5 per 1,000. Young children are overrepresented in foster care. While children under 5 make up 28% of the total statewide population under the age of 18, children under 5 comprised 38% of the total number of children in foster care. Rates ranged from 1.0 in Plaquemines Parish to 20.2 per 1,000 children in Washington Parish. Children in the Florida Parishes region (five parishes in southeast Louisiana, north of Lake Pontchartrain) are significantly impacted by the foster care system. In 2019, 20% of all Louisiana children under age 5 in foster care were from this region, while accounting for only 12.6% of the total state population of children under 5. Overall, Louisiana's rate of children entering foster care has declined each year since 2016. One possible reason for this decline is the emphasis on family preservation and intensive in-home services to strengthen families.

46 Early Childhood Risk and Reach in Louisiana Risk | WINTER 2021

RATE OF YOUTH AGES 10-20 INVOLVED WITH THE JUVENILE JUSTICE SYSTEM (PER 1,000 YOUTH; CY 2017)

Youth arrests significantly increase risk for a number of issues, including mental health problems such as depression and anxiety; injury and premature death, particularly due to suicide and self-harm; stigmatization and subsequent arrests; substance abuse; lower educational achievement, and unemployment.⁸⁵⁻⁹⁰

In Louisiana, 8.4 youths (ages 10-20) per 1,000 were under the supervision of the Office of Juvenile Justice in 2017. Within Louisiana, this rate ranges from 2.8 per 1,000 in Plaquemines Parish to 34.5 per 1,000 in Red River Parish. This rate does not include youth in the adult criminal justice system or youth who are served by parish juvenile courts that operate their own probation and parole systems (Calcasieu, Caddo, East Baton Rouge, Jefferson, and Rapides). In 2018, Louisiana had the highest juvenile arrest rate for any state in the country, and the third highest juvenile arrest rates for aggravated assault and weapons charges.⁹¹

There are significant racial disparities in juvenile arrest rates. In particular, Black youth are more likely to be arrested than their White peers.⁹² Additionally, youth with special needs and youth living in poverty are more likely to be arrested.⁹³⁻⁹⁵ Boys are charged and detained at disproportionately higher rates as compared to girls.⁹⁶ All of these factors point to larger systemic issues that impact youth throughout their lives.

Before 2019, Louisiana was one of only nine states that excluded 17-year-olds from being placed in the juvenile justice system. This meant that youth who entered the justice system at age 17 were sent to adult jails upon arrest, and their arrests and convictions were entered into public record. If sentenced to incarceration, they were sent to adult prisons. In 2016, Louisiana Act 501 changed this law, such that in 2019, 17-year-olds charged with non-violent offenses began entering the juvenile justice system and in 2020, 17 year olds charged with violent offenses began entering the juvenile justice system.⁹⁷

RISK: SOCIAL & COMMUNITY CONTEXT CONCLUSION

The social context of a child's family and community plays an important role in healthy development. Healthy relationships with caregivers are the cornerstone of early brain development for young children. Children need at least one reliable and responsive caregiver to develop the cognitive, language, and social-emotional skills that underlie good health, educational attainment, and fulfilling social relationships later in life.98 Safe, nurturing relationships also foster resilience in young children, acting as a protective factor against later challenges and adversities they may experience.98

When young children do not have a nurturing and responsive caregiver, they can experience physical, emotional, cognitive, and language delays and disorders.⁹⁹ Non-responsive caregiving may be characterized by abuse or neglect, both of which can cause physical and mental health problems during childhood and throughout the lifespan.¹⁰⁰ Infants are at greatest risk for abuse and neglect, with risk generally declining every year after that.¹⁰¹ Maltreatment, along with a host of other Adverse Childhood Experiences (ACEs), has been linked to increased risk for heart attack, cancer, substance abuse, depression, and early death.¹⁰²

The effects of the COVID-19 pandemic on child maltreatment in Louisiana are not yet fully understood, although risk factors for child maltreatment-including economic hardship, housing and food instability, caregiver stress and reduced access to social supports-have increased throughout the pandemic. Furthermore, reduced contact with mandated reporters (such as doctors, teachers, and coaches) may mean that a higher proportion of child maltreatment cases are going unreported.

When a case of child maltreatment is reported and confirmed, the first course of action is to make every attempt possible to support a family in providing a safe, nurturing, and responsive environment for the child. Sometimes, when safety cannot be established in a child's family home, they

are temporarily placed in foster care. Foster families may be relatives or other adults known to the child, or they may be entirely unrelated. Placement in foster care has decreased in Louisiana over the past several years, potentially due to the child welfare system's increased emphasis on prioritizing family preservation and support.

While most children who experience maltreatment and foster care placement do not become involved with the criminal justice system, many young people who are arrestedparticularly for violent offenses-have experienced abuse and/or neglect.¹⁰³ Placement in foster care, and particularly unstable placements that result in children moving among foster homes, further increases the risk that youth will become involved in the juvenile justice system, as compared to their peers in the child welfare system who are not placed in foster care.¹⁰⁴ The 2016 passage of Louisiana Act 501 brought 17-year-olds back into the juvenile justice system, instead of automatically entering the adult criminal justice system. Involvement in the adult criminal justice system often results in longer sentences, despite the fact that juvenile crime rates peak in the late teenage years and then decline.¹⁰⁵ In fact, 40-60% of youth who commit crimes do not reoffend, suggesting that long sentences for crimes committed in the teenage years may not be necessary to deter future offenses.¹⁰⁶

Fortunately, there are evidence-based interventions that support healthy relationships and behaviors and reduce both child maltreatment and interactions with the criminal justice system. Nurse-Family Partnership (which the Louisiana Department of Health currently administers through the Maternal, Infant, and Early Childhood Home Visiting Program), has been shown to decrease both child maltreatment and juvenile arrests and convictions.^{107,108} Psychosocial treatments such as Multisystemic Therapy have been shown to reduce recidivism in youth.¹⁰⁹ Ensuring sustainable funding so that families can access these programs will promote safe and secure families and communities.

PERCENTAGE OF CHILDREN AGES 0-2 FROM ECONOMICALLY DISADVANTAGED HOUSEHOLDS WHO LACK ACCESS TO PUBLICLY FUNDED CHILD CARE (ACADEMIC YEAR 2018-2019)

A child's brain develops rapidly, with the majority of development in foundational brain pathways such as sensory (vision, hearing), language, and higher cognition happening by age 3.¹¹⁰ Children from economically disadvantaged households who participate in high-quality early care and education programs experience lifelong benefits: they are more likely to do well in school and graduate on time.¹¹¹ The inverse is true for children who lack access to high-quality early care and education: they are less likely to enter kindergarten ready to learn, are more likely to have lower incomes after graduating high school, and are associated with higher crime rates.¹¹¹ Decades of research, led by economist Dr. James Heckman, has shown that investing in high-quality early care and education interventions provides a substantial return on public investment.¹¹²

In Louisiana, 93.2% of children ages 0-2 from economically disadvantaged households lack access to publicly funded child care. Even in Orleans and East Baton Rouge Parishes, which offer the most options for publicly funded child care, 83% and 90% of economically disadvantaged infants and toddlers still lack access, respectively. This problem is even more pronounced in rural areas—infants and toddlers in six rural parishes do not have access to any publicly funded, licensed child care (East Feliciana, Assumption, Caldwell, Cameron, Catahoula, and West Carroll). Throughout 2020, the COVID-19 pandemic has significantly impacted enrollment in child care centers across the state, and many providers will continue to struggle without additional public investment.¹¹³

54 Early Childhood Risk and Reach in Louisiana Risk | WINTER 2021

PERCENTAGE OF CHILDREN AGE 3 FROM ECONOMICALLY DISADVANTAGED HOUSEHOLDS WHO LACK ACCESS TO PUBLICLY FUNDED CHILD CARE (ACADEMIC YEAR 2018-2019)

A child's brain develops rapidly, with the majority of development in foundational brain pathways such as sensory (vision, hearing), language, and higher cognition happening by age 3.¹¹⁰ Children from economically disadvantaged households who participate in high-quality early care and education programs experience lifelong benefits: they are more likely to do well in school and graduate on time.¹¹¹ The inverse is true for children who lack access to high-quality early care and education: they are less likely to enter kindergarten ready to learn, are more likely to have lower incomes after graduating high school, and are associated with higher crime rates.¹¹¹ Decades of research, led by economist Dr. James Heckman, has shown that investing in high-quality early care and education interventions provides a substantial return on public investment.¹¹²

Access to publicly funded early care and education in Louisiana varies significantly by child age, which is why this indicator was broken down into two age groups. In Louisiana, 65.5% of 3-year-old children from economically disadvantaged households lack access to publicly funded early care and education. Within Louisiana, there is a significant range of access to early care and education for 3-year-olds among parishes. Pointe Coupee Parish reported that every economically disadvantaged 3-year-old child has access to publicly funded early care and education; however, in five parishes over 90% of economically disadvantaged 3-year-old children lack access to publicly funded child care. Throughout 2020, the COVID-19 pandemic has significantly impacted enrollment in child care centers across the state (see Conclusion), and many providers will continue to struggle without additional public investment.¹¹³

Early Childhood Risk and Reach in Louisiana Risk | WINTER 2021

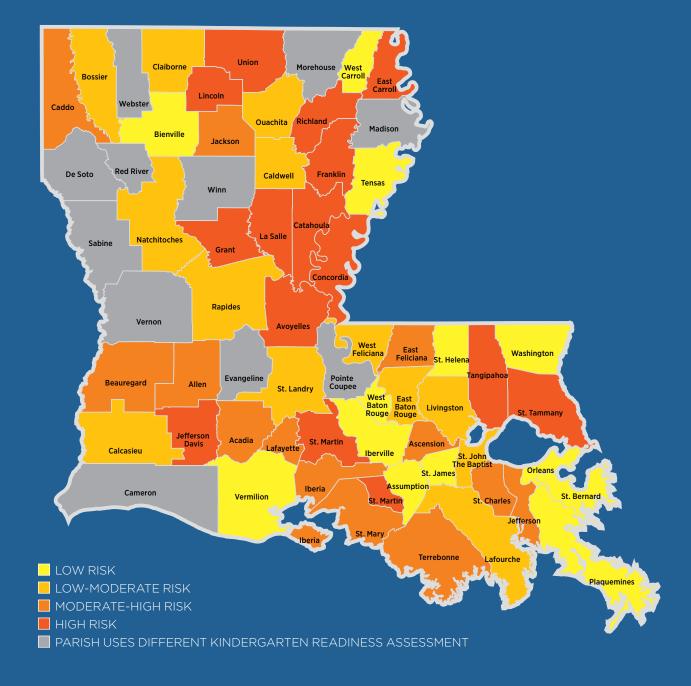

PERCENTAGE OF CHILDREN NOT MEETING LITERACY STANDARDS AT PUBLIC KINDERGARTEN ENTRY (FALL 2019)

It is critical for young children to have access to opportunities to build their literacy skills starting at birth and continuing through their early elementary years. According to national data, only 1 in 10 children who are not reading at grade level by the end of first grade will ever catch up to the reading grade level of their peers.¹¹⁴ Acadience Reading (previously named DIBELS Next) is a research-based standardized literacy screener that measures early literacy skills that help predict later reading success.¹¹⁵ Louisiana law and the Louisiana Board of Elementary and Secondary Education (BESE) require that school systems administer one of four approved literacy screeners within 30 days of the beginning of each school year to all students in public kindergarten through grade 3, of which Acadience Reading is the most common.¹¹⁶ This requirement aligns with research demonstrating that annual screening is vital to ensure that all students are on the right track to become proficient readers by the end of third grade.¹¹⁷ Significant time and financial investments in teacher training, curriculum materials, family engagement activities, and birth to age 5 programming are required to ensure that all children are skillful readers by third grade.

Across the state, 50.9% of kindergarteners in public school systems did not meet literacy standards and were considered "at risk" for reading difficulties in Fall 2019. The school systems with the lowest early literacy levels were East Feliciana, Webster, Catahoula, and Morehouse, where over 65% of children were at risk of delayed reading development at the beginning of kindergarten. While a similar measure was included in the 2016 Risk and Reach Report, the method for calculating reading development has changed; therefore direct comparisons are not appropriate. Parishes with missing data for this indicator used a different literacy screener that is not directly comparable to the Acadience Reading.

58 Early Childhood Risk and Reach in Louisiana Risk | WINTER 2021

PERCENTAGE OF STUDENTS IN PUBLIC SCHOOL WHO ENTER PUBLIC KINDERGARTEN READY TO LEARN (FALL 2019)

Kindergarten marks a transition point for children as they move from early learning and development settings to the K–12 system. While this is not a "test," data collected through teachers' observations of students' participation in routine classroom activities during the first 30 days of kindergarten offer a glimpse into children's early experiences and provide a baseline for both kindergarten instruction and measuring future progress.¹¹⁸ A growing body of research indicates that learning and development in the early years, including those before kindergarten entry, provide the foundation for future educational achievement.¹¹⁹ Differences in academic performance tend to begin early and persist, often worsening over time. The Desired Results Developmental Profile for Kindergarten (DRDP-K), one of two research-based Kindergarten Entry Assessments (KEA) used in Louisiana, assesses students across 27 measures in five domains:

- Approaches to Learning and Self-Regulation
- Social Emotional Development
- Language and Literacy Development
- Cognition: Math
- Physical Development

In order to indicate overall readiness defined by the Louisiana Department of Education, students' scores must demonstrate readiness on four of the five domains (all but physical development). The DRDP-K was piloted in 2017-2018 and is now the most commonly used KEA, having been used to assess more than 90% of students in 2018-2019.

While there have been steady and incremental increases in the percent of students indicating readiness since the DRDP-K was first administered, results reported by districts indicate that across Louisiana, less than 20% of students assessed using the DRDP-K were considered "ready to learn" at the beginning of the 2019 school year. There was a wide range of readiness scores across the state. In five parishes (East Carroll, St. Martin, Richland, St. Tammany, and Franklin), districts reported less than 5% of students entered kindergarten ready to learn. In Washington Parish, which reports the highest performance on the DRDP-K, 58.1% of students demonstrated readiness. Washington was the only parish in which the school district reported that more than half of students demonstrated readiness. In 41 parishes, fewer than 25% of students indicated readiness on all four domains at kindergarten entry.

Some trends emerged across subgroups in the 2019-2020 data. Factors associated with greater kindergarten readiness included family economic stability, speaking English as a first language, being a girl, having no developmental disabilities, and attending school-based pre-K. Data limitations prevent analysis to determine the effect of other types of early care and education programs on kindergarten readiness in Louisiana (child care centers, family child care, etc); however, extensive research exists nationally that demonstrates attendance in a high-quality school-based child care center or Head Start program positively impacts kindergarten readiness.¹²⁰

RISK: EDUCATION ACCESS & QUALITY CONCLUSION

While kindergarten often marks the beginning of formal schooling for most children, learning begins long before that-in fact, learning begins at birth.¹²¹ Young children learn by observing, interacting, and playing with their parents, caregivers, siblings, and peers.¹²² In addition to basic needs like food, shelter, and sleep, children need safe and stimulating environments with responsive adults to develop the skills they need to thrive in school and life.¹²³ High-quality early childhood care and education programs allow children to build upon the foundational cognitive, language, and social-emotional skills they gained through rich interactions with caregivers and family members.124 Research shows that children who participate in these programs are more likely to have better academic outcomes. and better health outcomes as well.125

Access to high quality child care early in life is not only beneficial for children, it is frequently essential for their parents and caregivers. Today, most children grow up in households where every adult works. According to a Louisiana Policy Institute for Children report, Losing Ground: How Child Care Impacts Louisiana's Workforce Productivity and *the State Economy*, 67% of Louisiana children from birth through age 5 have either both parents, or their single parent, in the workforce.¹²⁶ Access to quality child care has become an indispensable piece of a thriving economy with a growing workforce. Unfortunately, child care remains inaccessible for many Louisiana families: statewide, fewer than 10% of economically disadvantaged children ages 0-2 and 34% of economically disadvantaged 3-year-olds have access to publicly funded care and education. Without affordable access to quality child care, parents may not be able to work full-time or at all, or may have to rely on lower quality options for care. The crisis in access to child care in Louisiana has harmful effects on children, parents, and the economy.126

The child care industry has also been significantly affected by the COVID-19 pandemic, which forced 70% of child care centers to close in the spring of 2020, and continues to limit enrollment even as many centers re-open.127 Decreased enrollment in child care affects the rest of the early childhood system, as it reduces opportunities for early identification of developmental delays and referrals to EarlySteps.

Lack of access to quality child care causes many children to begin kindergarten without the skills they need to learn and succeed in school.128 In 2019, over half (50.9%) of children entering kindergarten in Louisiana did not have the early literacy skills considered developmentally appropriate for their age. When considering comprehensive kindergarten readiness-which includes cognitive and social-emotional development, in addition to language-districts using the DRDP-K Kindergarten Entry Assessment report that fewer than 20% of children entering kindergarten met all the benchmarks indicating that they are "ready to learn." These delays tend to persist; only 1 in 10 children who are not reading on grade level by the end of first grade will ever catch up to their peers reading at grade level.¹²⁹ In January 2020, the Louisiana Early Literacy Commission's report asked the state to commit to building a "seamless support system for early learning."¹³⁰ The commission recommended the use of evidence-based curricula and practices to complement a rigorous menu of literacy supports and interventions for struggling readers.

Recent improvements in data collection and linkage will help inform efforts to improve access to, and quality of, early care and education in Louisiana. The Louisiana Department of Education's new EdLink 360 data system can connect enrollment and assessment data from early learning centers to the kindergarten through 12th grade (K-12) data systems, providing longitudinal data (the first of its kind) to guide efforts to improve educational outcomes. There is room to build upon this progress: integrating data from early care and education providers with the rest of the early childhood data system (including EarlySteps, MIECHV, and healthcare providers) could increase early identification of developmental delays in children, ensure that referrals between programs are completed in a timely fashion, and allow early childhood professionals from multiple systems to work together to support children. Greater integration between data systems could also allow the Louisiana Department of Education, the Louisiana Department of Health, and the Department of Children and Family Services to measure the impact of early childhood programs and investments on kindergarten readiness and educational attainment for Louisiana children, two factors that support lifelong health and well-being.

PERCENTAGE OF HOUSEHOLDS WITH SEVERE HOUSING PROBLEMS (2012-2016)

Inadequate housing can have a negative impact on children's physical and mental health, as well as their general well-being.^{131,132} Poor housing conditions can lead to an increase in mold, mites, and other allergens which may lead to or exacerbate respiratory conditions, including asthma.¹³³ Inadequate kitchen conditions have been linked to respiratory illness and some types of cancer.¹³⁴ Poor housing conditions can also increase children's risk of cardiovascular conditions, falls, and developmental delays.^{135,136}

Housing cost burdens, which have increased over time, can also cause negative outcomes for children, including eviction and homelessness, overcrowding, poor nutrition, frequent moving, and lack of supervision while parents are at work. Overcrowding, for example, has been associated with physical illness (such as tuberculosis and respiratory infections), psychological distress among both adults and children, and low cognitive achievement.^{136,137} There are vast disparities in housing problems in the United States, particularly by income and race, but also by gender. Individuals with lower incomes and people of color are more likely to occupy homes with severe physical problems as compared to the general population.¹³⁸

This indicator from the County Health Rankings Initiative reflects the percentage of households with at least one of the following severe housing problems:

- 1. Housing unit lacks complete kitchen facilities
- 2. Housing unit lacks complete plumbing facilities
- 3. Household is overcrowded
- 4. Household is severely cost burdened

Louisiana performs slightly better than the nation as a whole with regard to the percentage of households with at least one severe housing problem (16% in Louisiana vs 18.4% nationally). However, there is a great deal of variation across Louisiana parishes: 5% of households in West Carroll had at least one severe housing problem, as compared to 26% in Orleans. While severe housing problems are present in both urban and rural communities, it is notable that some of the state's main population centers show higher levels of housing problems, with Orleans, Jefferson, East Baton Rouge, and Caddo Parishes all in the highest quartile. The impacts of these housing problems on families in Louisiana has become more pronounced throughout the COVID-19 pandemic, as families try to balance lost jobs or reduced hours and the transmission risks associated with overcrowding.

HEALTHY FOOD ENVIRONMENT INDEX, FROM 0 (WORST) TO 10 (BEST) (DATA FROM 2015 & 2017)

Having access to a healthy food environment is one of the most critical factors associated with healthy nutrition at the population level.¹³⁹ This indicator measures the parish level population's ability to purchase healthy foods, accounting for both household income and proximity to stores that traditionally sell healthy foods. Because eating patterns are established early in life, it is important that children are exposed to healthy foods starting in early childhood.¹⁴⁰⁻¹⁴² Consuming a healthy diet reduces the risk for obesity and an array of chronic diseases, including cardiovascular disease, Type 2 diabetes, and some cancers.^{143,144} The presence of supermarkets and grocery stores selling healthy foods in one's neighborhood, as well as having the financial means to buy these healthy foods, impacts the nutritional quality of children's diets.¹⁴⁵

The Food Environment Index ranges from a scale of 0 (worst) to 10 (best) and equally weights two indicators of the food environment:

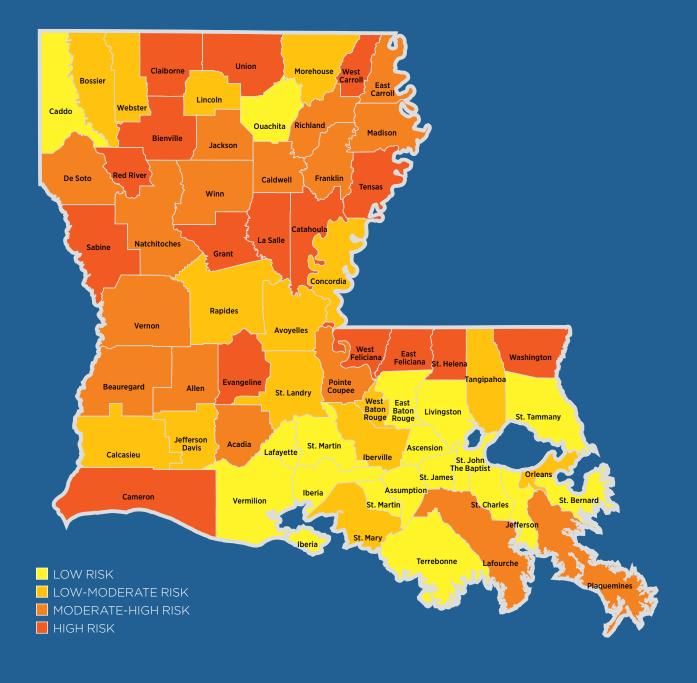

- LIMITED ACCESS TO HEALTHY FOODS estimates the percentage of the population that is low income and does not live close to a grocery store. Low income is defined as having an annual family income of less than or equal to 200% of the federal poverty threshold for the family size. Living close to a grocery store is defined differently in rural and nonrural areas; in rural areas, it means living less than 10 miles from a grocery store whereas in nonrural areas it means less than 1 mile.
- **FOOD INSECURITY** estimates the percentage of the population that did not have access to a reliable source of food during the past year. A two-stage fixed effects model was created using information from the Community Population Survey, Bureau of Labor Statistics, and American Community Survey to estimate food insecurity.

Louisiana's food environment earns a score of 5.2 on the food environment index. This is worse than the nation as a whole, which has a score of 7.6 on the index. There is significant variation within the state, with scores ranging from 3.5 in East Carroll Parish to 9.0 in Cameron. 54 out of 64 parishes (84%) have scores below the national average.

Nationwide, there are significant differences in access to healthy foods by race/ethnicity. Black families in particular tend to have lower household incomes, on average, and are less likely than non-Hispanic White families to live close to a supermarket.^{146,147} In general, accessing healthy food is more difficult in rural areas compared to urban areas.¹⁴⁸ Hurricanes and the COVID-19 pandemic have affected healthy food environments in Louisiana in multiple ways, including disrupted household income and grocery store closures due to storm damage or decreases in store revenue.

PERCENTAGE OF HOUSEHOLDS WITH INTERNET ACCESS (2013-2017)

Access to internet services measures the percentage of the population that has access to a home internet connection at or above the speed which "enables users to originate and receive high-quality voice, data, graphics, and video telecommunications" (according to the Federal Communications Commission [FCC], this is 25 Megabits per second [Mbps] download/3 Mbps upload).¹⁴⁹ Children and families who have limited access to the internet and devices that connect to it experience "digital inequality."150 Families with no or limited connectivity experience reduced access to a wide range of opportunities available online, from job applications, to remote work, to virtual learning, and more. Many families with access to fixed internet services still often "face limitations in the form of service cutoffs, slow service, older technology, or difficulty using equipment because too many people are sharing devices."150 Researchers have found that "the more connectivity challenges families face, the less they use the internet to help them access opportunities that support family stability and wellbeing."151 For example, compared to parents with fixed internet access, parents with cellular-only internet access are significantly less likely to apply for jobs or services they qualify for online, including healthrelated resources, which are increasingly migrating online.¹⁵¹

According to the FCC's 2019 Broadband Deployment Report, Louisiana ranks 38th among states for access to internet services.¹⁵² The indicator in this report measures household-level access to fixed internet services, cellular-only LTE services, or both. In Louisiana, 87.6% of households have access to the internet, while nationwide, 93.4% of households have internet access. Within Louisiana, 47 of 64 parishes (73%) fall below the national average. In urban areas, 96.5% of Louisianians have access to internet services, compared to 98.3% of the urban population nationally. Louisiana's rural parishes fare worse than the national average for rural areas, as well: 63.6% of Louisiana's rural population has access to internet services, compared to the national average of 73.6%. Louisiana has 18 parishes in which less than 50% of the population has access to internet services. In Tensas Parish only 0.5% of the population has adequate internet access. In total, approximately 580,000 Louisianians do not have access to internet services.152

Early Childhood Risk and Reach in Louisiana Risk | WINTER 2021

PERCENTAGE OF POPULATION WITH ACCESS TO EXERCISE OPPORTUNITIES (DATA FROM 2010 & 2019)

It is well-established that safe, accessible spaces for play and exercise, such as parks, gyms, and recreational facilities, are beneficial for physical and mental health, social satisfaction, and general well-being.¹⁵³ Young children particularly benefit from these spaces, as children rely on play for cognitive, physical, and social-emotional development in their earliest years.¹⁵⁴ Across the lifespan, people who live near paved sidewalks, parks, and gyms exercise more regularly, with reduced rates of diabetes, cancer, stroke, hypertension, and premature mortality.¹⁵⁵⁻¹⁵⁷ The COVID-19 pandemic has demonstrated the value of such spaces to Louisiana residents as people seek places to get outside, exercise, and engage in outdoor activities.

Access to exercise opportunities measures the percentage of individuals in a county/parish who live reasonably close to a location for physical activity. Locations for physical activity are defined as parks or recreational facilities. Individuals are considered to have access to exercise opportunities if they:

- Reside in a census block that is within a half mile of a park, or
- Reside in an urban census block that is within 1 mile of a recreational facility, or
- Reside in a rural census block that is within 3 miles of a recreational facility.

Across Louisiana, 75% of the population is considered to have access to parks and recreational facilities. There is significant variation within the state. Only 15% of the population in Beauregard, Tensas, and West Feliciana Parishes live near parks and recreational facilities, while over 90% of the population in Jefferson, East Baton Rouge, and Orleans Parishes live near such facilities. In general, people living in or near cities in Louisiana have greater access to parks and recreational facilities than people living in rural areas.

RISK: NEIGHBORHOOD & BUILT ENVIRONMENT

Louisiana's unique natural and man-made environments, climate, and history shape the health and well-being of even its youngest residents. Safe houses and neighborhoods that provide easy access to affordable healthy food, reliable internet, and public parks create conditions for healthy children, strong families, and thriving economies.¹⁵⁸

The homes in which children grow up have significant effects on their growth and development. When families live in overcrowded or substandard housing, children may be exposed to mold or lead, eat less nutritious food, and experience disrupted sleep, all of which negatively impact children's health and ability to learn.¹⁵⁹ Households with affordable and reliable internet connections are better equipped to find and access education and employment opportunities.¹⁶⁰ The COVID-19 pandemic has made the importance of stable internet access more clear than ever before. Families have had to shift to virtual learning for their children. Many people needed to work from home, while those in occupations that do not lend themselves to remote work either lost their jobs or faced increased risk of contracting COVID-19 while at work. Those who lost jobs have had to rely on the internet to apply for unemployment insurance. In the health and medical realm, doctors' visits became virtual. Adequate internet access guickly became essential for families to function. While efforts must be made to increase access to fixed internet service, state level service providers should also continue to develop mobile-friendly tools and platforms to improve access to services for individuals with cellular-only internet access and those who prefer to access the internet on a cellular device.

Beyond their individual household, a child's neighborhood and built environment impacts their ability to thrive.¹⁵⁸ Access to affordable, nutritious food is a key part of a healthy neighborhood. When grocery stores are expensive or far from home, families may have to rely on corner stores and fast food to feed their children, resulting in health and learning problems that may persist into adolescence and adulthood.¹⁶¹ Similarly, access to well-paved sidewalks and safe, clean parks help families cultivate and sustain active and healthy lifestyles.¹⁶²

Louisiana families also contend with specific geographic and historical factors that impact each of the indicators included in this report. Natural disasters, such as hurricanes and floods, cause repeated damage to houses, businesses, parks, and the natural environment. As a result, significant public and private resources are spent repairing and maintaining the built environment, making it more difficult to create and maintain health-promoting environments.¹⁶³ There is also a history of policies that have directly contributed to disparities in home ownership and exposure to environmental toxins, particularly by race (e.g., redlining) and income.¹⁶⁴

There are numerous features of the natural and built environment that significantly impact the health and well-being of children that are not included in this report, for a variety of reasons. Many environmental indicators that are significantly associated with health outcomes are difficult to measure, or data collection is expensive. For instance, indoor air quality has a bigger impact on children's health than outdoor air quality, but it would be extremely challenging to measure air quality in private homes, schools, churches, and stores, and harder still to capture and report on those data.¹⁶⁵ It can also be difficult to quantify access to reliable transportation across the state at the parish level. A meaningful transportation indicator would have to take into account multiple factors of private and public transit (vehicle ownership; the existence, reliability, and coverage of public transit systems; road quality and bike lanes) that would be difficult to compare across urban and rural settings.

In 18 parishes, less than 50% of households have internet access.

OVERALL RISK

Overall risk is calculated by averaging risk quartiles for each of the 21 risk indicators included in this report. Thus, the overall risk for a given parish is measured relative to other parishes—it is not an absolute appraisal of risk to children. Overall risk also does not necessarily indicate that a parish received High or Moderate-High assessments on all indicators. For example:

Overall, 63 of 64 parishes (98%) are rated as High Risk on at least one indicator and 62 of 64 parishes (97%) are rated as Low Risk on at least one indicator.

Of the parishes rated as High Risk overall, 89% are rated as Low Risk on at least one indicator, while 94% of the parishes rated Low Risk overall have at least one High Risk indicator.

These data demonstrate that every parish has strengths to build upon, as well as vulnerabilities to address.

ECONOMIC STABILITY

Five risk indicators measure a type of economic risk facing young children:

- Percentage of children under age 5 living in poverty
- Parish level median income as a percentage of the Federal Poverty Level
- Percentage of households below ALICE (Asset Limited, Income Constrained, Employed) threshold
- Percentage of SNAP recipients under age 5
- Percentage of births to mothers with less than high school education

32 of the 64 parishes in Louisiana (50%) were rated as High Risk on at least one of the Economic Risk indicators.

HEALTHCARE ACCESS & QUALITY

Five of the risk indicators measure a type of health risk facing young children:

- Preterm birth rate (percentage)
- Rate of substance exposed newborns (per 1,000 births)
- Infant mortality rate (per 1,000 births)
- Percentage of children ages 3-5 insured by Medicaid who did not have a well-child visit this year
- Percentage of children under age 5 insured by Medicaid who did not have a preventive dental visit this year

39 of the 64 parishes in Louisiana (61%) were rated as High Risk on at least one of the Health Risk indicators.

SOCIAL & COMMUNITY CONTEXT

Three of the risk indicators measure a type of risk present in a child's social & community context:

- Maltreatment rate of children under age 5 (per 1,000 children)
- Rate of children under age 5 in foster care (per 1,000 children)
- Rate of youth ages 10-20 involved with the juvenile justice system (per 1,000 youth)

29 of the 64 parishes in Louisiana (45%) were rated as High Risk on at least one of the Social & Community Context indicators.

EDUCATION ACCESS & QUALITY

Four of the risk indicators measure a type of risk to a child's educational achievement:

- Percentage of children ages 0-2 from economically disadvantaged households who lack access to publicly funded child care
- Percentage of children age 3 from economically disadvantaged households who lack access to publicly funded child care
- Percentage of children not meeting literacy standards at public kindergarten entry
- Percentage of students in public school who enter public kindergarten ready to learn

45 of the 64 parishes in Louisiana (70%) were rated as High Risk on at least one of the Education indicators.

NEIGHBORHOOD & BUILT ENVIRONMENT

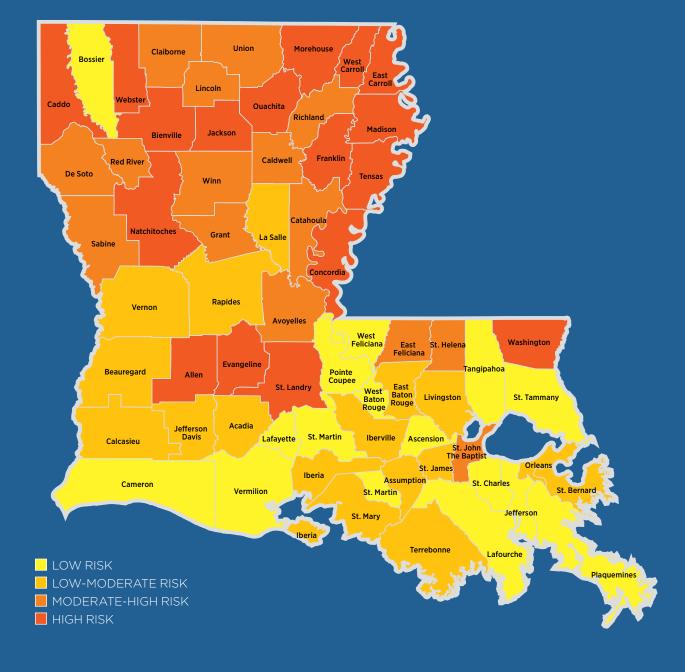

Four of the risk indicators measure a type of risk present in a child's neighborhood and built environment:

- Percentage of households with severe housing problems
- Healthy food environment index
- Percentage of households with internet access
- Percentage of population with access to exercise opportunities

43 of the 64 parishes in Louisiana (67%) were rated as High Risk on at least one of the Neighborhood and Built Environment indicators.

TABLE 3. Young Children in Louisiana by Risk Level

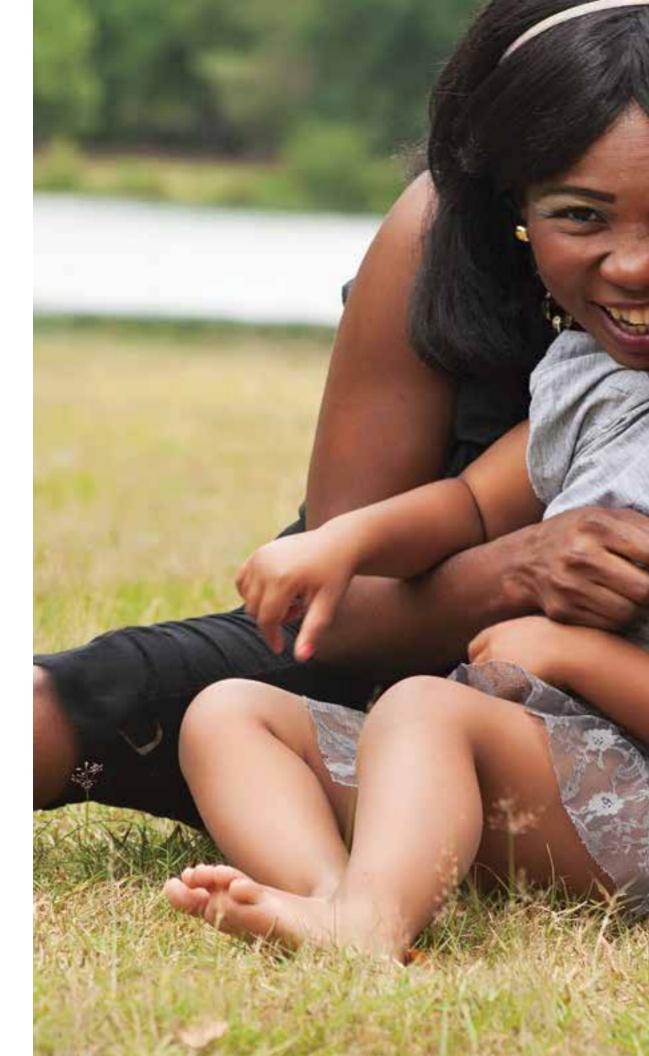

"Reach" refers to the level to which publicly-funded programs are reaching children and families across Louisiana. These programs are intended to mitigate many of the risks outlined in the first section of this report. Reach was determined by requesting parish level enrollment data from the Louisiana Department of Health and the Department of Education for eight key publicly funded early childhood programs and services. Similar to the risk indicators, reach indicators are sorted into ranked quartiles based on enrollment—the first quartile represents parishes with the highest percentage of eligible children and families enrolled in these programs. Reach information is overlaid onto the map of Overall Risk in order to demonstrate the reach of these programs relative to the need (risk) of each parish.

Two health programs are included in this report that were not included in the 2016 report: children under age 5 enrolled in Medicaid, and eligible parents and children under age 5 enrolled in the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC). Education reach is also presented differently in this report compared to 2016. Rather than showing the reach of specific funding streams for publicly funded pre-kindergarten (Title I, NSECD, 8(G), LA 4), overall access to high quality, publicly funded child care for children ages 0-3 from economically disadvantaged households is included, as well as pre-k for children age 4 from economically disadvantaged households. This change was made to show a more complete picture of access to publicly funded early learning opportunities, and to highlight the differences in access between different age groups.

REACH INDICATORS OF PUBLICLY FUNDED PROGRAMS SERVING CHILDREN AGES 0-5:

- Children Under Age 5 Insured by Medicaid (May 2020)
- Special Supplemental Nutrition Program for Women, Infants, & Children (WIC; May 2019)
- > IDEA Part C Early Intervention: EarlySteps (November 2019)
- Maternal, Infant, and Early Childhood Home Visiting (MIECHV; Fiscal Year 2019)
- Early Head Start (Fall 2018)
- ▶ Head Start (Fall 2018)
- Eligible Children Ages 0-3 Enrolled in High Quality, Publicly Funded Early Care and Education (Fall 2019)
- Eligible Children Age 4 Enrolled in High Quality, Publicly Funded Early Care and Education (Fall 2019)

CHILDREN UNDER AGE 5 INSURED BY MEDICAID (MAY 2020)

Medicaid provides medical benefits to low-income individuals and families. In Louisiana, over a million residents receive healthcare coverage through Medicaid, most of whom are children under age 19.¹⁶⁶ Louisiana Medicaid contracts with private Managed Care Organizations to deliver Medicaid services to the majority of its enrollees. Children and pregnant women may be eligible for Medicaid coverage through programs such as the Louisiana Children's Health Insurance Program (LaCHIP) and LaMOMS.

Medicaid covers preventive, well-child care as well as specialty care for children's physical and mental health concerns.¹⁶⁷ During a child's first 5 years of well-child visits, pediatric providers should administer vaccinations, conduct physical health checks, and screen for general and social-emotional development and autism. Caregivers are screened for depression at well-child visits during the first 6 months of a child's life due to the potential negative effects of untreated caregiver mental illness on child development. Pediatric primary care serves as a crucial source of referrals and care coordination for children and families with special health and developmental needs.

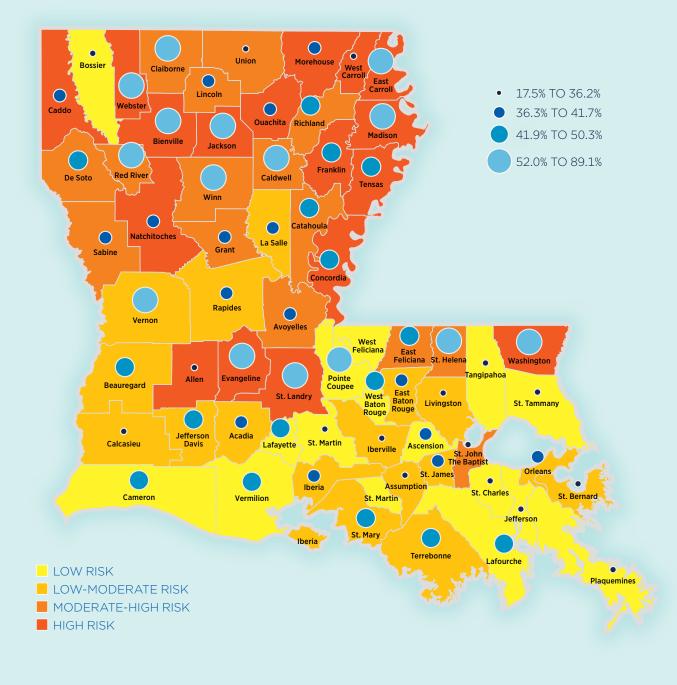

Medicaid covers 65.1% of children under age 5 in Louisiana, making it the largest source of healthcare funding by far for this population. Medicaid enrollment ranges from 29% in Cameron Parish to 88.9% in Catahoula Parish. The COVID-19 pandemic has presented additional barriers to care delivery in Louisiana, leading to delayed or missed immunizations, well-child visits, and health screenings.¹⁶⁸ Additional services and screenings for children and youth with special healthcare needs and for pregnant and postpartum parents have also been delayed or absent.

ELIGIBLE PARENTS AND CHILDREN UNDER AGE 5 ENROLLED IN WIC (MAY 2019)

The Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) provides supplemental foods, healthcare referrals, breastfeeding support, and nutrition education to lowincome pregnant and postpartum parents, and to infants and children up to age 5 who are found to be at nutritional risk. Parents and caregivers of eligible children can enroll their children into the WIC Program and receive benefits on their behalf. The Louisiana WIC Program plays a critical role in addressing food insecurity. Louisiana WIC also administers the WIC Breastfeeding Peer Counselor Program (BFPC) through a separate federal grant. The BFPC Program provides support beyond current clinical operations and services to WIC participants by making peer-counseling services available to breastfeeding clients outside the WIC clinic environment and beyond usual clinic hours of operation. Families served by WIC show improved nutrition, cognitive development, and higher academic achievement compared to eligible families that are not enrolled in WIC.169

Across Louisiana, WIC serves 39.1% of parents and children who are eligible for the program. There is substantial variation in the eligible population served, from only 29.6% in St. Tammany Parish to 89.1% in both Red River and St. Helena Parishes. West Feliciana is the only parish in Louisiana without a WIC office. During the COVID-19 pandemic, Louisiana WIC has experienced a decline in overall participation.

CHILDREN UNDER AGE 3 ENROLLED IN EARLYSTEPS (NOVEMBER 2019)

The Individuals with Disabilities Education Act (IDEA) Part C Early Intervention Program—administered in Louisiana as EarlySteps provides services to families with infants and toddlers under age 3 who have developmental delays or diagnosed conditions that are likely to result in developmental delays. EarlySteps is required under IDEA to provide services to any child that meets the developmental or medical eligibility criteria, regardless of income. Services include family support coordination, occupational therapy, physical therapy, speech/language therapy, psychology, and audiology, among others. For decades, research has proven that high-quality early intervention services are extremely effective at improving cognitive, language, and social-emotional development, as well as overall health in children.¹⁷⁰ Further, investments in early intervention programs reduce the economic burden associated with the cost of special education services by minimizing the need for such services.¹⁷¹⁻¹⁷³

Across Louisiana, EarlySteps serves 3.3% of infants and toddlers before their third birthday. EarlySteps is offered in every Louisiana parish, with program reach ranging 0.4% of children served in Cameron Parish to 6.2% in East Carroll Parish. In 16 parishes, EarlySteps serves at least 3.7% of the child population, thereby meeting or exceeding the national average (3.5%) of children served in early intervention.¹⁷⁴

The number of referrals to and children served by EarlySteps has increased by 21% since 2015.¹⁷⁵ Even with more restrictive eligibility criteria implemented in 2013 as a cost control measure, EarlySteps is now serving more children than ever before, suggesting that there may be a broader population of children who would benefit from EarlySteps who do not meet the more restrictive eligibility criteria. The COVID-19 pandemic and the ensuing partial or full closure of pediatricians' offices and child care centers resulted in a decrease in referrals from March to June of 2020. Since June, the referral rate and total number of children served have increased, but have not returned to the levels attained prior to March 2020. In order to continue serving families in the COVID-19 pandemic, EarlySteps transitioned first to a fully virtual model of service delivery, then later to a hybrid service delivery model, with a blend of virtual and in-person services, in cases where this was safe and requested by families.

• in FY 2019, there was no home visitor serving Cameron parish.

ELIGIBLE CHILDREN SERVED BY MATERNAL, INFANT, AND EARLY CHILDHOOD HOME VISITING (MIECHV; FY 2019)

The Louisiana Maternal, Infant, and Early Childhood Home Visiting (LA MIECHV) family support and coaching program is a part of the Louisiana Department of Health's Bureau of Family Health. LA MIECHV is a free, voluntary program that implements two evidence-based home visiting models, Nurse-Family Partnership (NFP) and Parents as Teachers (PAT). The program provides support to pregnant and parenting families with young children in all 64 parishes, though specific eligibility requirements vary by model. To qualify for either model, families must be eligible for Medicaid, WIC, SNAP, Temporary Assistance to Needy Families (TANF), or Supplemental Security Income (SSI) at the time of enrollment. Nurses implementing NFP provide services and supports to firsttime parents and families starting in early pregnancy until the child's second birthday. Parent educators implementing PAT provide services and supports to expectant or parenting families from pregnancy until the child enters kindergarten. Services provided to participating families include health education and coaching; support in building positive parenting skills and caregiving confidence; help setting and reaching personal goals (such as returning to school or work); and connection and referrals to services and community resources. Key program outcomes include improved economic self-sufficiency, early identification of developmental delays, improved child health and development, improved school readiness, and decreased rates of child maltreatment.176-183

Across the state, LA MIECHV serves 1.4% of eligible children. Program reach ranges from 0.9% of all eligible children in East Baton Rouge Parish to 8.8% in Jefferson Davis. In order to continue serving families during the COVID-19 pandemic, LA MIECHV shifted service delivery entirely to telehealth. Support is primarily provided over the phone due to limited data plans and/or lack of technology required to participate in virtual visits via video chat platforms such as FaceTime or Zoom. This limits nurses' and parent educators' ability to assess family-child interactions and child behaviors, and to complete required developmental and mental health screenings. While LA MIECHV has continued to conduct outreach to families and community partners across the state to enroll clients and families, the program has experienced a marked decrease in referrals as a result of the COVID-19 pandemic.

• These 41 parishes do not have Early Head Start programs.

ELIGIBLE CHILDREN AGES 0-2 ENROLLED IN EARLY HEAD START (FALL 2018)

Early Head Start programs serve pregnant parents and infants and toddlers under the age of 3. These programs provide intensive comprehensive child development and family support services to pregnant parents, infants, and toddlers from low-income households. Services are designed to meet the full range of a family's needs, from pregnancy through age 2. Early Head Start has been associated with improved cognitive, language, and social-emotional development, as well as improved parent-child interactions, and parent engagement with their child's development.¹⁸⁴ Evidence also suggests that participation in Early Head Start reduces aggressive behaviors in children.¹⁸⁵ Eligibility for Early Head Start is most frequently based on family income (most families must be at or below 100% of the federal poverty level). 10% of program funds serve children with special needs or who are eligible for special education services, regardless of income. Funds are granted to public and private agencies by the federal Office of Head Start, rather than the state.

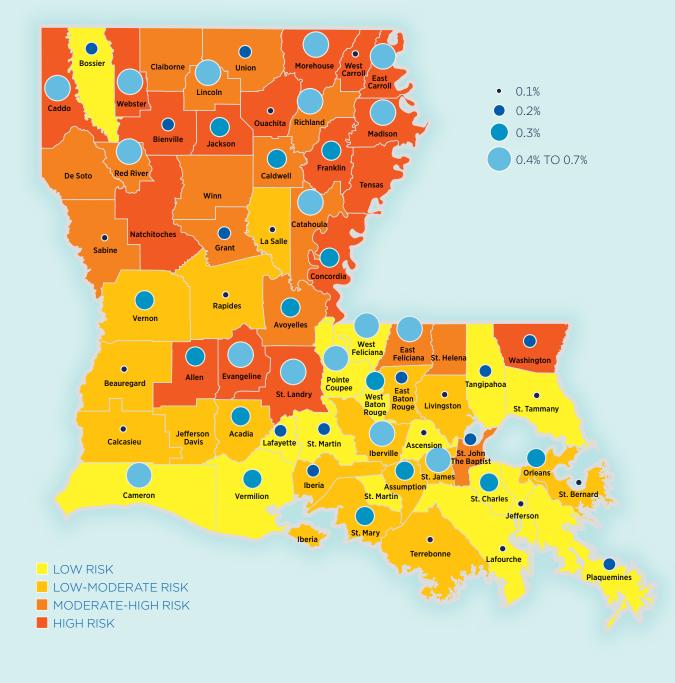

Early Head Start is only available in 23 parishes across Louisiana, 2.1% of eligible children ages 0-2 are enrolled. Among the parishes with Early Head Start programs, enrollment ranges from 0.8% of infants and toddlers from economically disadvantaged households in Vermilion Parish to 12.1% in West Feliciana.

ELIGIBLE CHILDREN AGES 3-4 ENROLLED IN HEAD START (FALL 2018)

Head Start (HS) programs provide free, comprehensive early learning services to children ages 3-4. These programs support children's growth in a positive learning environment through a variety of services designed to support the child's health, early learning, and development, as well as family well-being. Participation in Head Start is associated with better cognitive, language, and social-emotional development, as well as increased overall health and kindergarten readiness, improved educational attainment and reduced criminal activity later in life.¹⁸⁶⁻¹⁸⁸ Eligibility for Head Start is most frequently based on family income (most families must be at or below 100% of the federal poverty level). 10% of program funds serve children with special needs or who are eligible for special education services, regardless of income. Funds are granted to public and private agencies by the federal Office of Head Start rather than the state.

Head Start is available in 58 parishes—across Louisiana, 0.2% of eligible 3- and 4-year-old children are enrolled. Among the parishes with Head Start programs, enrollment ranges from 0.1% of eligible children in 14 different parishes to 0.7% in East Feliciana.

ELIGIBLE CHILDREN AGES 0-3 ENROLLED IN HIGH QUALITY, PUBLICLY FUNDED EARLY CARE AND EDUCATION (FALL 2019)

Children from economically disadvantaged households who participate in high quality, publicly funded early childhood care and education programs are healthier and more likely to do well in school and graduate on time from high school.¹⁸⁹ They are also less likely to interact with the criminal justice system as adults.¹⁹⁰ Research from Economist James Heckman has also demonstrated that the economic returns of high quality early care and education for children from lowincome households outweigh the investment, making investments in public early care and education a smart investment of public funds.¹⁹¹

In Louisiana, every classroom in publicly funded child care, Head Start, and pre-K sites is observed using the CLASS tool. These observations are used to calculate Performance Ratings for each publicly funded site. Sites rated Proficient or higher are considered "high quality." The reach data presented here reflects 2018-2019 Performance Profiles, published in November 2019.

In Louisiana, only 11% of children under 4 from economically disadvantaged households are enrolled in high quality early childhood care and education. Only five parishes have at least 20% of children from economically disadvantaged households enrolled in high quality, publicly funded early childhood programs. One reason for the limited availability of publicly funded infant and toddler care (compared to the availability of care for 4-year-olds) is the additional costs associated with providing high quality care for very young children, including the need for lower student-to-teacher ratios. Many families struggle to afford quality child care, while many child care centers struggle to make ends meet, highlighting a need for greater subsidies for infant and toddler care.

ELIGIBLE CHILDREN AGE 4 ENROLLED IN HIGH QUALITY, PUBLICLY FUNDED EARLY CARE AND EDUCATION (FALL 2019)

Children from economically disadvantaged households who participate in high quality, publicly funded early childhood care and education programs are healthier and more likely to do well in school and graduate on time from high school.¹⁸⁹ They are also less likely to interact with the criminal justice system as adults.¹⁹⁰ Research from economist James Heckman has also demonstrated that the economic returns of high quality early care and education for children from lowincome households outweigh the investment, making investments in public early care and education a smart investment of public funds.¹⁹¹

In Louisiana, every classroom in publicly funded child care, Head Start, and pre-K sites is observed using the CLASS tool. These observations are used to calculate Performance Ratings for each publicly funded site. Sites rated Proficient or higher are considered "high quality." The reach data presented here reflects 2018-2019 Performance Profiles, published in November 2019.

In contrast to the previous data for 0-to-3-year-olds, 87% of 4-yearold children from economically disadvantaged households in Louisiana have access to high quality, publicly funded early care and education. In 34 parishes, 90% or more of 4-year-old children from economically disadvantaged households have access to high quality care and education. Conversely, in Caddo, East Carroll and Lafourche parishes, less than 50% of 4-year-old children from economically disadvantaged households have access. The high levels of access to care for this group is a testament to the years of collaborative work done by the Louisiana Department of Education, early childhood advocates, and the Louisiana state government.

CONCLUSION

RISK

There are an estimated 307,092 children under age 5 in Louisiana (see Appendix 1 for population under age 5 by parish). As detailed in the Overall Risk section (see pages 75-77), of the 64 parishes:

- ▶ 16 are in the Low Risk category
- ▶ 16 are in the Low-Moderate Risk category
- ▶ 13 are in the Moderate-High Risk category
- ▶ 19 are in the High Risk category

73,228 children live in either the Moderate-High or High Risk parishes, representing approximately 24% of all children under age 5 in Louisiana. Risk rankings are determined relative to other parishes in the state, meaning that the risk described in this report is not a comparison to any other county or state in the country. This information, complemented by the separate Early Childhood System Integration Budget, is designed to be used by all early childhood stakeholders, governmental and nongovernmental, in order to better inform policy and funding decisions and the distribution of critical resources.¹⁹²

REACH

Good data are essential to inform programmatic and investment decisions regarding the distribution of resources that support Louisiana's young children. Based on parish level data provided by state agencies, the percentage of eligible children enrolled in early childhood programs was mapped showing program enrollment juxtaposed with overall risk in each parish. These maps are not intended to be conclusive, but are designed to visually display available services relative to overall need, or risk. There are various reasons why there may not be a direct correlation between services and risk, but program leaders and policymakers can use this information to better calibrate resource distribution for maximum efficacy and impact.

LIMITATIONS

Computing the Overall Risk Level as an average of each of the individual risk indicators assumes each indicator has the same weight toward the overall well-being of children. Of course, the reality may be that some risk indicators are more strongly associated with overall risk than others. However, there is substantial research to show that the total number of risk factors present is more strongly associated with poor outcomes than any one specific risk factor.¹⁹³ Furthermore, we are limited to including data only from existing data sets that are available at the parish level. While other data may be valuable in determining risk, if those data are not available at the parish level, then it is not possible to include them in this report. Finally, under the best of circumstances risk at the level of the individual neighborhood could be measured; measuring at the parish level is necessarily a blunt instrument. As to the reach data, the reader should be aware that services may have expanded or contracted in FY 2021 as compared to the time period reported here.

CONTACT US

You are invited to share any feedback or comments on this data, analysis, or report, as the hope is that this is an evolving project that will adapt to meet usage demands by public and/or private stakeholder groups. We also would like to know how your stakeholder group used the information. Please contact Amy Zapata at the Bureau of Family Health (Amy.Zapata@la.gov) with your comments or suggestions by sending an email with "Risk and Reach Report Inquiry" in the subject line.

TABLE 4. Young Children in Louisiana by Risk Level

RISK GROUP	NUMBER OF PARISHES	PERCENTAGE OF CHILDREN (0-5)
Low	16	37.3%
Low-Moderate	16	38.8%
Moderate-High	13	5.8%
High	19	18.0%

APPENDIX 3. Data Sources and Description

INDICATOR	DATA SOURCE	DESCRIPTION
ge of Children ge 5 Living in (2014-2018)	National, State and Parish Level Data is available at the Census Website (www.census.gov)	Percentage of families with related children under 5 years whose income in the past 12 months is below the federal poverty level. Note: All parishes used five-year estimates from 2014-2018.
vel Median s a Percentage al Poverty Level 18)	Median Family Income and Poverty Threshold at the Census Website (www.census.gov)	The median household income is the midpoint in the range of household income for those surveyed for years 2014-2018 divided by the 2019 Federal Poverty Limit for families of four.
entage of Households w ALICE set Limited, Income	United Way ALICE 2020 Report	The ALICE Threshold represents the minimum income level necessary for survival for a household. Derived from the household survival budget, the ALICE threshold is rounded to American Community Survey income category and adjusted for households to reach the ALICE Threshold despite both income and assistance.
sset Linnee, Employed) preshold (alendar Year 2018)	National, state, and parish data can be found at https://www.unitedforalice.org/	Percentage below the ALICE Threshold includes both ALICE and poverty-level households. Details and methodology of ALICE report can be found at https://issuu.com/louisianaassociationofunitedway/docs/louisiana_alice_report_ august_6_2020_release?fr=sMDRIMTE2NjA0Mjg
rcentage of SNAP cipients Under Age 5 (2019)	Louisiana Department of Children and Family Services: SNAP (Supplemental Nutrition Assistance Program)	LA data derived from children under 5 years old receiving SNAP benefits divided by 2018 total LA child population ages under 5 years old.
entage of Births to ers with Less than School Education 1018)	Louisiana Department of Health - Office of Public Health, Vital Statistics	National data can be found in the 2018 Population Reference Bureau analysis of Centers for Disease Control and Prevention (CDC), National Center for Health Statistics (NCHS). The 2018 Louisiana Vital Records data are derived from the number of Louisiana mothers who have less than a high school education divided by the total number of 2018 Louisiana births.
erm Birth Rate	LA Department of Health -	National data can be found at https://www.marchofdimes.org/mission/ prematurity-reportcard-tv.aspx#:-:text=The%20preterm%20birth%20rate%20 in,to%2010.02%20percent%20in%202018.
rcentage; CY 2018)	Office of Public Health, Vital Statistics	2018 LA preterm birth data is derived from the number of babies born <37 weeks gestation divided by number of births for which gestational age is not missing. The preterm birth variable is derived from the gestational age variable.
of Substance osed Newborns 1,000 births; CY 2019)	Louisiana DCFS (Department of Children Family Services)	The rate of validated substance exposed newborns was derived by the number of newborns prenatally exposed to controlled substances or alcohol per 1,000 live births. LA DCFS data system only allows LA DCFS to capture data for the CPS Investigation case for the assigned worker location, not necessarily where the child resided at the time of the incident.
nt Mortality Rate r 1,000 births; 4-2018)	LA Department of Health - Office of Public Health, Vital Statistics	National 2014-2018 data can be found at the CDC WONDER https://wonder.cdc.gov/ Infant mortality rates are measured by the number of deaths among children under 1 year of age per 1,000 live births. An infant mortality rate may not be possible to determine in some parishes if the number of births or deaths is too small.
ercentage of Children ges 3-5 Insured by ledicaid Who Did Not lave a Well-Child Visit his Year (CY 2019)	LA Department of Health- Medicaid, Medicaid Eligibility	LA Medicaid data was derived from the number of children insured by Medicaid who did not have a well visit (ages 3-5) divided by the number of children insured by Medicaid 3-5 years old who had any health service claim.

APPENDIX 3. Data Sources and Description

INDICATOR	DATA SOURCE	DESCRIPTION	
Percentage of Students in Public School Who Enter Public Kindergarten Ready	Louisiana Department of Education, DRDP-K (Desired Results Developmental Profile—	The measure is derived from the number of students whose DRDP-K scores demonstrate readiness on all four of the following domains: Approaches to Learning & Self-Regulation, Social-Emotional Development, Language & Literacy Development, and Cognition: Math, divided by the total number of student records submitted. These scores are based on teachers' assessments of students within the first 30 school days of the school year. Thresholds for kindergarten readiness were set based on the Louisiana Early Learning & Development Standards behavioral indicators for A wore olde. Development Standards behavioral	
o Learn (Fall 2019)	Kindergarten) scores	indicators for 4-year-olds. Domain-level readiness is based on the average readiness across the readiness thresholds for measures categorized within that domain. The DRDP-K scores are submitted to the Louisiana Department of Education by Lead Educational Agencies across the state for all students enrolled in Kindergarten. While Lead Educational Agencies can choose between using the DRDP-K and TS Gold* Kindergarten Entry Assessment, most students in Louisiana are assessed using the DRDP-K.	
		This indicator represents the percentage of households in a parish with at least one of the following housing problems: incomplete kitchen facilities is defined as a unit	
Percentage of Households with Severe Housing Problems (2012-2016)	2020 County Health Rankings	which lacks a sink with running water, a stove or range, or a refrigerator. Incomple plumbing facilities is defined as lacking hot and cold piped water, a flush toilet, or bathtub/shower. Overcrowding is defined as more than 1 person per room. Sever cost burden is defined as monthly housing costs (including utilities) that exceed 5 of monthly income.	
		National, state, and parish level data can be found at https://www. countyhealthrankings.org/app/louisiana/2020/measure/factors/136/data The 2020 County Health Rankings used data from 2012-2016 for this measure.	
Healthy Food Environment Index (Data from 2015 & 2017)	2020 County Health Rankings	The Food Environment Index ranges from a scale of 0 (worst) to 10 (best) and equally weights two indicators of the food environment: 1) Limited access to healthy foods estimates the percentage of the population that is low income and does not live close to a grocery store. Low income is defined as having an annual family income of less than or equal to 200% of the federal poverty threshold for the family size. Living close to a grocery store is defined differently in rural and nonrural areas; in rural areas, it means living less than 10 miles from a grocery store whereas in nonrural areas, it means less than 1 mile. 2) Food insecurity estimates the percentage of the population that did not have access to a reliable source of food during the past year. A two-stage fixed effects model was created using information from the Community Population Survey, Bureau of Labor Statistics, and American Community Survey to estimate food insecurity. National, state, and parish level data can be found at https://www. countyhealthrankings.org/app/louisiana/2020/measure/factors/133/datasource	
Percentage of Households with Internet Access (2013-2017)	2019 Broadband Deployment Report	The 2020 County Health Rankings used data from 2015 and 2017 for this measure. This indicator represents the percentage of households in a parish with either 1) access to fixed internet services, 2) access to mobile LTE services, or 3) access to both fixed and mobile LTE services. This data is based on a 5-year estimate from 2013-2017. National, state, and parish data can be found at https://docs.fcc.gov/public/ attachments/FCC-19-44A1.pdf (Appendix 5 "Deployment of Fixed 25 Mbps/ 3 MBps and Mobile LTE 5 Mbps/ 1 Mbps Services by State and County")	

	DESCRIPTION							
	This indicator represents the population of households living in census blocks with adequate access to at least one location for physical activity. Adequate access is defined as census blocks where the border is a half-mile or less from a park, or 1 mile or less from recreational facility in urban census blocks and 3 miles or less in rural census blocks in 2019.							
	National, state, and parish data can be found at https://www.countyhealthrankings. org/app/louisiana/2020/measure/factors/132/datasource The 2020 County Health Rankings used data from 2010 and 2019 for this measure.							
	The measure was derived by the LA Number of enrolled children ages 0-4 years old divided by the LA 2018 child population 0-4 years old.							
	Medicaid eligibility data was captured at a point in time, May 2020							
olic	The measure was derived from the number of LA pregnant women and children (0-4) served by WIC in May 2019 divided by the number of LA Medicaid enrolled pregnant women and children (0-4 years old).							
	Medicaid data are limited to those enrolled in May 2020 and excludes those with a parish of 'not available' or 'out of state' in Medicaid files.							
ative	The measure was derived from the Cumulative Child Count of under 3 years old receiving Early Steps services divided by LA 2018 child population 0-2 years old.							
rly	The measure was derived by the number of children 0-4 years old served by MIECHV (including both Nurse Family Partnership and Parent As Teachers) divided by Medicaid enrolled children (0-4). Cameron Parish is served by surrounding parishes' teams. Medicaid data are limited to those enrolled in May 2020 and excludes those with a parish of 'not available' or 'out of state' in Medicaid files.							
unt	This measure was derived from the Child Count 2019's Early Head Start (EHS) Network Reported Child Count divided by the total number of Economically Disadvantaged children ages 0-2, which is achieved by using the Economically Disadvantaged K Cohort number for that parish multiplied by 3 (to account for three age cohorts: infants, ones, twos). Economically Disadvantaged Kindergarten Cohort: The Department of Education captures the number of 'Economically Disadvantaged' (aligned to Medicaid Eligibility – 200% of FPL) kindergarteners each year. LDOE uses this Economically Disadvantaged 'K Cohort' data as a proxy for the number of economically disadvantaged children in each age group by parish. This serves as the denominator for these data points and was captured in Fall 2019. Note: Some parishes have no Head Start services.							
unt	This measure was derived from the Child Count 2019's Head Start (HS) Network Reported Count divided by Economically Disadvantaged Children 3-4 years old, which is achieved by using the Economically Disadvantaged K Cohort number for that parish multiplied by 2 (to account for two age cohorts: threes, fours). Economically Disadvantaged Kindergarten Cohort: The Department of Education captures the number of 'Economically Disadvantaged' (aligned to Medicaid Eligibility; 200% of FPL) kindergarteners each year. LDOE uses this Economically Disadvantaged 'K Cohort' data as a proxy for the number of economically disadvantaged children in each age group by parish. This serves as the denominator for these data points and was captured in Fall 2019. Note: Some parishes have no Head Start services.							

APPENDIX 3. Data Sources and Description

INDICATOR	DATA SOURCE	DESCRIPTION
		The Department of Education captures a count of all children birth to age 5 who are enrolled in publicly funded early childhood spots/seats on October 1 of each year. The Department also rates the quality of each publicly funded site. The numerator is calculated by summing the total number of publicly funded children ages 0-3 who are enrolled in sites rated Proficient or higher.
High Quality Dublish	Louisiana Department of Education	That number is then divided by a proxy for the total number of Economically Disadvantaged children ages 0-3, which is achieved by using the Economically Disadvantaged K Cohort number for that parish multiplied by 4 (to account for four age cohorts: infants, ones, twos, threes).
High Quality Publicly Funded Early Care and Education for Children Ages 0-3		Three data are points involved: Economically Disadvantaged Kindergarten Cohort: The Department of Education captures the number of 'Economically Disadvantaged' (aligned to Medicaid Eligibility—200% of FPL) kindergarteners each year. LDOE uses this Economically Disadvantaged 'K Cohort' data as a proxy for the number of economically disadvantaged children in each age group by parish. This serves as the denominator for these data points and was captured in Fall 2019.
		Performance Profile Data: At least once per semester, every classroom at publicly- funded child care, Head Start, and pre-K sites is observed using the CLASS tool. These observations are used to calculate Performance Ratings for each publicly- funded site. Sites rated Proficient or higher are considered 'high quality.' This data reflects 2018-2019 Performance Profiles, published in November 2019.
		The Department of Education captures a count of all children birth to age 5 who are enrolled in publicly funded early childhood spots/seats on October 1 of each year. The Department also rates the quality of each publicly-funded site. The numerator is calculated by summing the total number of publicly-funded 4-year-old children enrolled in sites rated Proficient or higher.
High Quality Publicly		That number is then divided by a proxy for the total number of Economically Disadvantaged 4-year-olds, which is achieved by using the Economically Disadvantaged K Cohort number for that parish (to account for the 4-year-old age cohort).
Funded Early Care and Education for Children Age 4	Louisiana Department of Education	Three data are points involved: Economically Disadvantaged Kindergarten Cohort: The Department of Education captures the number of 'Economically Disadvantaged' (aligned to Medicaid Eligibility—200% of FPL) kindergarteners each year. LDOE uses this Economically Disadvantaged 'K Cohort' data as a proxy for the number of economically disadvantaged children in each age group by parish. This serves as the denominator for these data points and was captured in Fall 2019.
		Performance Profile Data: At least once per semester, every classroom at publicly- funded child care, Head Start, and pre-K sites is observed using the CLASS tool. These observations are used to calculate Performance Ratings for each publicly- funded site. Sites rated Proficient or higher are considered 'high quality.' This data reflects 2018-2019 Performance Profiles, published in November 2019.
Population of Children under Age 5 by Parish	Kids Count Data Center (2018)	National, state, and parish level data can be found at https://datacenter.kidscount.org/data/tables/1417-child-population-by-age- group#detailed/5/3220-3283/false/37/62/7924
